\end{array}\right) \cdot\binom{v_{x}}{v_{y}}+\left(\begin{array}{ll}
r_{x} & r_{y}
\end{array}\right) \cdot\left(\begin{array}{cc}
k & 0 \\
0 & k
\end{array}\right) \cdot\binom{r_{x}}{r_{y}} \\
& =\frac{1}{2} m v_{x}^{2} \quad+\frac{1}{2} m v_{y}^{2} \quad+\frac{1}{2} k r_{x}^{2} \quad+\frac{1}{2} k r_{y}^{2} \\
& =\frac{1}{2} m(-a \omega \sin \omega t)^{2}+\frac{1}{2} m(b \omega \cos \omega t)^{2}+\frac{1}{2} k(a \cos \omega t)^{2}+\frac{1}{2} k(b \sin \omega t)^{2} \\
& =\frac{1}{2} m a^{2} \omega^{2}\left(\sin ^{2} \omega t\right)+\frac{1}{2} m b^{2} \omega^{2}\left(\cos ^{2} \omega t\right)^{2}+\frac{1}{2} k a^{2}\left(\cos ^{2} \omega t\right)+\frac{1}{2} k b^{2}\left(\sin ^{2} \omega t\right) \\
& =\quad \text { Given }: k=m \omega^{2}
\end{aligned}
$$

$E=K E+P E=\frac{1}{2} m \omega^{2}\left(a^{2}+b^{2}\right)=\frac{1}{2} k\left(a^{2}+b^{2}\right)$ since: $\omega=\sqrt{\frac{k}{m}}=\sqrt{G \rho_{\oplus} 4 \pi / 3}$ or: $m \omega^{2}=k$

## Some Kepler's "laws" for central (isotropic) force F(r)

Angular momentum invariance of IHO: $F(r)=-k \cdot r$ with $U(r)=k \cdot r^{2} / 2$ (Derived $r$ igorously) Angular momentum invariance of Coulomb: $F(r)=-G M m / r^{2}$ with $U(r)=-G M m \cdot / r$ (Derived later)
Total energy $E=K E+P E$ invariance of $\mathrm{IHO}: F(r)=-k \cdot r$ (Derived rigorously)
$\longrightarrow$ Total energy $E=K E+P E$ invariance of Coulomb: $F(r)=-G M m / r^{2}$ (Derived later)

Kepler laws involve $\measuredangle$-momentum conservation in isotropic force $F(r)$
Now consider orbital energy conservation of the IHO: $F(r)=-k \cdot r$ with $U(r)=k \cdot r^{2} / 2$
Total $I H O$ energy $=K E+P E$ is constant

$$
\begin{aligned}
& K E+P E=\quad \frac{1}{2} \mathbf{v} \cdot \mathbf{M} \cdot \mathbf{v}+\frac{1}{2} \mathbf{r} \cdot \mathbf{K} \cdot \mathbf{r} \\
& =\frac{1}{2}\left(\begin{array}{ll}
v_{x} & v_{y}
\end{array}\right) \cdot\left(\begin{array}{cc}
m & 0 \\
0 & m
\end{array}\right) \cdot\binom{v_{x}}{v_{y}}+\left(\begin{array}{ll}
r_{x} & r_{y}
\end{array}\right) \cdot\left(\begin{array}{cc}
k & 0 \\
0 & k
\end{array}\right) \cdot\binom{r_{x}}{r_{y}} \\
& =\frac{1}{2} m v_{x}^{2} \quad+\frac{1}{2} m v_{y}^{2} \quad+\frac{1}{2} k r_{x}^{2} \quad+\frac{1}{2} k r_{y}^{2} \\
& =\frac{1}{2} m(-a \omega \sin \omega t)^{2}+\frac{1}{2} m(b \omega \cos \omega t)^{2}+\frac{1}{2} k(a \cos \omega t)^{2}+\frac{1}{2} k(b \sin \omega t)^{2} \\
& =\frac{1}{2} m a^{2} \omega^{2}\left(\sin ^{2} \omega t\right)+\frac{1}{2} m b^{2} \omega^{2}\left(\cos ^{2} \omega t\right)^{2}+\frac{1}{2} k a^{2}\left(\cos ^{2} \omega t\right)+\frac{1}{2} k b^{2}\left(\sin ^{2} \omega t\right) \\
& = \\
& \frac{1}{2} m \omega^{2}\left(a^{2}+b^{2}\right) \\
& \text { Given }: k=m \omega^{2}
\end{aligned}
$$

$$
E=K E+P E=\frac{1}{2} m \omega^{2}\left(a^{2}+b^{2}\right)=\frac{1}{2} k\left(a^{2}+b^{2}\right) \text { since: } \omega=\sqrt{\frac{k}{m}}=\sqrt{G \rho_{\oplus} 4 \pi / 3} \text { or: } m \omega^{2}=k
$$

We'll see that the Coul. orbits are simpler: (like the period...not a function of $b$ )
$E=K E+P E=\frac{1}{2} m v_{x}^{2}+\frac{1}{2} m v_{y}^{2}-\frac{k}{r}=\frac{1}{2} m v_{x}^{2}+\frac{1}{2} m v_{y}^{2}-\frac{G M_{\oplus} m}{r}=-\frac{G M_{\oplus} m}{a}$

Quadratic forms and tangent contact geometry of their ellipses
A matrix $Q$ that generates an ellipse by $\mathbf{r} \bullet Q \cdot \mathbf{r}=1$ is called positive-definite $\mathbf{r} \bullet \mathbf{Q} \bullet \mathbf{r} \quad=1$

$$
\left(\begin{array}{ll}
x & y
\end{array}\right) \cdot\left(\begin{array}{cc}
\frac{1}{a^{2}} & 0 \\
0 & \frac{1}{b^{2}}
\end{array}\right) \cdot\binom{x}{y}=1=\left(\begin{array}{ll}
x & y
\end{array}\right) \cdot\binom{\frac{x}{a^{2}}}{\frac{y}{b^{2}}}=\frac{x^{2}}{a^{2}}+\frac{y^{2}}{b^{2}}
$$

A inverse matrix $Q^{-1}$ generates an ellipse by $\mathbf{p}^{\bullet} Q^{-1} \cdot \mathbf{p}=1$ called inverse or dual ellipse:

$$
\begin{gathered}
\mathbf{p} \bullet \mathbf{Q}^{-1} \bullet \mathbf{p} \\
\left(\begin{array}{ll}
p_{x} & p_{y}
\end{array}\right) \cdot\left(\begin{array}{cc}
a^{2} & 0 \\
0 & b^{2}
\end{array}\right) \cdot\binom{p_{x}}{p_{y}}= \\
=1=\left(\begin{array}{ll}
p_{x} & p_{y}
\end{array}\right) \cdot\binom{a^{2} p_{x}}{b^{2} p_{y}}=a^{2} p_{x}^{2}+b^{2} y^{2}
\end{gathered}
$$

(a) Quadratic form ellipse and Inverse quadratic form ellipse

(b) Ellipse tangents
vector $\dot{\mathbf{p}}(\phi)$ is perpendicular

$$
\text { to } \mathbf{r}(\phi)
$$

Unit 1
Fig. 11.6
unit

Note some quadratic form muatual duality relations:

$$
\mathbf{p}=\mathbf{Q} \cdot \mathbf{r}=\left(\begin{array}{cc}
1 / a^{2} & 0 \\
0 & 1 / b^{2}
\end{array}\right) \bullet\binom{x}{y}=\binom{x / a^{2}}{y / b^{2}}=\binom{(1 / a) \cos \phi}{(1 / b) \sin \phi} \text { where: } \begin{gathered}
x=r_{x}=a \cos \phi=a \cos \omega t \\
y=r_{y}=b \sin \phi=b \sin \omega t
\end{gathered}
$$

$$
\text { so: } \mathbf{p} \cdot \mathbf{r}=1
$$

$\mathbf{p}$ is perpendicular to velocity $\mathbf{v}=\dot{\mathbf{r}}, a$ mourual onthogonality
$\dot{\mathbf{r}} \bullet \mathbf{p}=0=\left(\begin{array}{ll}\dot{r}_{x} & \dot{r}_{y}\end{array}\right) \bullet\binom{p_{x}}{p_{y}}=\left(\begin{array}{ll}-a \sin \phi & b \cos \phi\end{array}\right) \bullet\binom{(1 / a) \cos \phi}{(1 / b) \sin \phi}$ where: $\begin{aligned} & \dot{r}_{x}=-a \sin \phi \\ & \dot{r}_{y}=b \cos \phi\end{aligned}$ and: $\begin{aligned} & p_{x}=(1 / a) \cos \phi \\ & p_{y}=(1 / b) \sin \phi\end{aligned}$
