# Group Theory in Quantum Mechanics Lecture 5 (1.27.15)

Spectral Decomposition with Repeated Eigenvalues

(Quantum Theory for Computer Age - Ch. 3 of Unit 1) (Principles of Symmetry, Dynamics, and Spectroscopy - Sec. 1-3 of Ch. 1)

Review: matrix eigenstates ("ownstates) and Idempotent projectors (Non-degeneracy case) Operator orthonormality, completeness, and spectral decomposition(Non-degenerate e-values)

(Preparing for: Degenerate eigenvalues)

*Eigensolutions with degenerate eigenvalues (Possible?... or not?) Secular* → *Hamilton-Cayley* → *Minimal equations* Diagonalizability criterion

*Nilpotents and "Bad degeneracy" examples:*  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ , and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ Applications of Nilpotent operators later on

Idempotents and "Good degeneracy" example:  $\mathbf{G} = \begin{pmatrix} \cdots & 1 \\ \cdots & 1 \\ \vdots \\ 1 \\ \cdots \\ 1 \\ \cdots \end{pmatrix}$ Example of minimal equation projection

Orthonormalization of degenerate eigensolutions *Projection*  $\mathbf{P}_{i}$ *-matrix anatomy (Gramian matrices)* Gram-Schmidt procedure

Orthonormalization of commuting eigensolutions. Examples:  $\mathbf{G} = \begin{bmatrix} \cdots & \cdots & 1 \\ \cdots & 1 & \cdots \\ 1 & \cdots & \cdots \end{bmatrix}$  and:  $\mathbf{H} = \begin{bmatrix} \cdots & 2 & \cdots \\ \cdots & 2 & 2 \\ 2 & \cdots & 2 \\ \cdots & 2 & \cdots \\ \vdots & 2 & \cdots \end{bmatrix}$ 

The old "1=1.1 trick"-Spectral decomposition by projector splitting Irreducible projectors and representations (Trace checks) *Minimal equation for projector* **P**=**P**<sup>2</sup> *How symmetry groups become eigen-solvers* 

Review: matrix eigenstates ("ownstates) and Idempotent projectors (Non-degeneracy case) Operator orthonormality, completeness, and spectral decomposition(<u>Non-degenerate</u> e-values)

```
Eigensolutions with degenerate eigenvalues (Possible?... or not?)
   Secular → Hamilton-Cayley → Minimal equations
   Diagonalizability criterion
Nilpotents and "Bad degeneracy" examples: \mathbf{B} = (\mathbf{N} - \mathbf{N}), and \mathbf{N} = (\mathbf{N} - \mathbf{N})
   Applications of Nilpotent operators later on
Idempotents and "Good degeneracy" example: G=
   Secular equation by minor expansion
    Example of minimal equation projection
Orthonormalization of degenerate eigensolutions
    Projection P<sub>i</sub>-matrix anatomy (Gramian matrices)
    Gram-Schmidt procedure
Orthonormalization of commuting eigensolutions. Examples: G=
                                                                              and: H=
    The old "1=1.1 trick"-Spectral decomposition by projector splitting
    Irreducible projectors and representations (Trace checks)
    Minimal equation for projector P=P<sup>2</sup>
    How symmetry groups become eigen-solvers

(Preparing for: Degenerate eigenvalues)

Review: matrix eigenstates ("ownstates) and Idempotent projectors (Degeneracy case) Operator orthonormality, completeness, and spectral decomposition(Degenerate e-values)

 Eigensolutions with degenerate eigenvalues (Possible?... or not?)
 Secular→ Hamilton-Cayley→Minimal equations Diagonalizability criterion

*Eigensolutions with degenerate eigenvalues (Possible?... or not?)* What if *secular equation* ( $det|M-\varepsilon_j\mathbf{1}|-0$ ) of *N-by-N* matrix **H** has  $\ell$ -repeated  $\varepsilon_l$ -roots { $\varepsilon_{l_l}, \varepsilon_{l_2}... \varepsilon_{l_\ell}$ }?

If so, it's possible **H** can't be completely diagonalized, though this is rarely the case.

*Eigensolutions with degenerate eigenvalues (Possible?... or not?)* What if *secular equation* ( $det|M-\varepsilon_j\mathbf{1}|-0$ ) of *N-by-N* matrix **H** has  $\ell$ -repeated  $\varepsilon_l$ -roots { $\varepsilon_{l_l}, \varepsilon_{l_2}... \varepsilon_{l_\ell}$ }?

If so, it's possible **H** can't be completely diagonalized, though this is rarely the case. It all depends upon whether or not the *HC equation* really *needs* its repeated factors. *Eigensolutions with degenerate eigenvalues (Possible?... or not?)* What if *secular equation* (*det*|M- $\varepsilon_j$ **1**|-0) of *N-by-N* matrix **H** has  $\ell$ -repeated  $\varepsilon_l$ -roots { $\varepsilon_{l_l}, \varepsilon_{l_2}... \varepsilon_{l_\ell}$ }?

If so, it's possible  $\mathbf{H}$  can't be completely diagonalized, though this is rarely the case. It all depends upon whether or not the *HC equation* really *needs* its repeated factors.

Suppose each eigenvalue  $\varepsilon_j$  is  $\ell_j$ -fold degenerate so *secular equation (SEq)* factors as follows:  $S(\varepsilon) = 0 = (-1)^N (\varepsilon - \varepsilon_1)^{\ell_1} (\varepsilon - \varepsilon_2)^{\ell_2} \dots (\varepsilon - \varepsilon_p)^{\ell_p} \text{ where: } \ell_1 + \ell_2 + \dots + \ell_p = N$  *Eigensolutions with degenerate eigenvalues (Possible?... or not?)* What if *secular equation* ( $det|M-\varepsilon_j\mathbf{1}|-0$ ) of *N-by-N* matrix **H** has  $\ell$ -repeated  $\varepsilon_l$ -roots { $\varepsilon_{l_l}, \varepsilon_{l_2}... \varepsilon_{l_\ell}$ }?

If so, it's possible  $\mathbf{H}$  can't be completely diagonalized, though this is rarely the case. It all depends upon whether or not the *HC equation* really *needs* its repeated factors.

Suppose each eigenvalue  $\varepsilon_j$  is  $\ell_j$ -fold degenerate so *secular equation (SEq)* factors as follows:  $S(\varepsilon) = 0 = (-1)^N (\varepsilon - \varepsilon_1)^{\ell_1} (\varepsilon - \varepsilon_2)^{\ell_2} \dots (\varepsilon - \varepsilon_p)^{\ell_p} \text{ where: } \ell_1 + \ell_2 + \dots + \ell_p = N$ 

Then the *HC equation (HCeq)* is a matrix equation of degree *N* with **H** replacing  $\varepsilon$  in *SEq*:  $S(\varepsilon) \rightarrow S(\mathbf{H})$ 

$$S(\mathbf{H}) = \mathbf{0} = (-1)^{N} (\mathbf{H} - \boldsymbol{\varepsilon}_{1} \mathbf{1})^{\ell_{1}} (\mathbf{H} - \boldsymbol{\varepsilon}_{2} \mathbf{1})^{\ell_{2}} \dots (\mathbf{H} - \boldsymbol{\varepsilon}_{p} \mathbf{1})^{\ell_{p}} \text{ where: } \boldsymbol{\ell}_{1} + \boldsymbol{\ell}_{2} + \dots + \boldsymbol{\ell}_{p} = N$$

*Eigensolutions with degenerate eigenvalues (Possible?... or not?)* What if *secular equation*  $(det|M-\varepsilon_j\mathbf{1}|-0)$  of *N-by-N* matrix **H** has  $\ell$ -repeated  $\varepsilon_1$ -roots  $\{\varepsilon_{I_1}, \varepsilon_{I_2}... \varepsilon_{I_\ell}\}$ ?

If so, it's possible  $\mathbf{H}$  can't be completely diagonalized, though this is rarely the case. It all depends upon whether or not the *HC equation* really *needs* its repeated factors.

Suppose each eigenvalue  $\varepsilon_j$  is  $\ell_j$ -fold degenerate so *secular equation (SEq)* factors as follows:  $S(\varepsilon) = 0 = (-1)^N (\varepsilon - \varepsilon_1)^{\ell_1} (\varepsilon - \varepsilon_2)^{\ell_2} \dots (\varepsilon - \varepsilon_p)^{\ell_p} \text{ where: } \ell_1 + \ell_2 + \dots + \ell_p = N$ 

Then the *HC equation (HCeq)* is a matrix equation of degree *N* with **H** replacing  $\varepsilon$  in *SEq*:  $S(\varepsilon) \rightarrow S(\mathbf{H})$ 

$$S(\mathbf{H}) = \mathbf{0} = (-1)^{N} (\mathbf{H} - \varepsilon_{1} \mathbf{1})^{\ell_{1}} (\mathbf{H} - \varepsilon_{2} \mathbf{1})^{\ell_{2}} \dots (\mathbf{H} - \varepsilon_{p} \mathbf{1})^{\ell_{p}} \text{ where: } \ell_{1} + \ell_{2} + \dots + \ell_{p} = N$$
  
The number  $\ell_{k}$  is called the *degree of degeneracy* of eigenvalue  $\varepsilon_{k}$ .

Thursday, January 22, 2015

*Eigensolutions with degenerate eigenvalues (Possible?... or not?)* What if *secular equation*  $(det|M-\varepsilon_j\mathbf{1}|-0)$  of *N-by-N* matrix **H** has  $\ell$ -repeated  $\varepsilon_1$ -roots  $\{\varepsilon_{I_1}, \varepsilon_{I_2}... \varepsilon_{I_\ell}\}$ ?

If so, it's possible  $\mathbf{H}$  can't be completely diagonalized, though this is rarely the case. It all depends upon whether or not the *HC equation* really *needs* its repeated factors.

Suppose each eigenvalue  $\varepsilon_j$  is  $\ell_j$ -fold degenerate so *secular equation (SEq)* factors as follows:  $S(\varepsilon) = 0 = (-1)^N (\varepsilon - \varepsilon_1)^{\ell_1} (\varepsilon - \varepsilon_2)^{\ell_2} \dots (\varepsilon - \varepsilon_p)^{\ell_p} \text{ where: } \ell_1 + \ell_2 + \dots + \ell_p = N$ 

Then the *HC equation (HCeq)* is a matrix equation of degree *N* with **H** replacing  $\varepsilon$  in *SEq*:  $S(\varepsilon) \rightarrow S(\mathbf{H})$ 

$$S(\mathbf{H}) = \mathbf{0} = (-1)^{N} (\mathbf{H} - \varepsilon_{1} \mathbf{1})^{\ell_{1}} (\mathbf{H} - \varepsilon_{2} \mathbf{1})^{\ell_{2}} \dots (\mathbf{H} - \varepsilon_{p} \mathbf{1})^{\ell_{p}} \text{ where: } \ell_{1} + \ell_{2} + \dots + \ell_{p} = N$$
  
The number  $\ell_{k}$  is called the *degree of degeneracy* of eigenvalue  $\varepsilon_{k}$ .

The minimum power integers  $\mu_k \leq \ell_k$ , that still make  $S(\mathbf{H}) = \mathbf{0}$ , form the *minimal equation (MEq)* of **H**.

$$\mathbf{0} = (-1)^{N} (\mathbf{H} - \boldsymbol{\varepsilon}_{1} \mathbf{1})^{\mu_{1}} (\mathbf{H} - \boldsymbol{\varepsilon}_{2} \mathbf{1})^{\mu_{2}} \dots (\mathbf{H} - \boldsymbol{\varepsilon}_{p} \mathbf{1})^{\mu_{p}} \quad \text{where:} \quad \boldsymbol{\mu}_{1} + \boldsymbol{\mu}_{2} + \dots + \boldsymbol{\mu}_{p} = N_{MIN} \leq N$$

*Eigensolutions with degenerate eigenvalues (Possible?... or not?)* What if *secular equation* (*det*|M- $\varepsilon_j$ **1**|-0) of *N-by-N* matrix **H** has  $\ell$ -repeated  $\varepsilon_l$ -roots { $\varepsilon_{l_l}, \varepsilon_{l_2}... \varepsilon_{l_\ell}$ }?

If so, it's possible  $\mathbf{H}$  can't be completely diagonalized, though this is rarely the case. It all depends upon whether or not the *HC equation* really *needs* its repeated factors.

Suppose each eigenvalue  $\varepsilon_j$  is  $\ell_j$ -fold degenerate so *secular equation (SEq)* factors as follows:  $S(\varepsilon) = 0 = (-1)^N (\varepsilon - \varepsilon_1)^{\ell_1} (\varepsilon - \varepsilon_2)^{\ell_2} \dots (\varepsilon - \varepsilon_p)^{\ell_p} \text{ where: } \ell_1 + \ell_2 + \dots + \ell_p = N$ 

Then the *HC equation (HCeq)* is a matrix equation of degree *N* with **H** replacing  $\varepsilon$  in *SEq*:  $S(\varepsilon) \rightarrow S(\mathbf{H})$ 

$$S(\mathbf{H}) = \mathbf{0} = (-1)^{N} (\mathbf{H} - \varepsilon_{1} \mathbf{1})^{\ell_{1}} (\mathbf{H} - \varepsilon_{2} \mathbf{1})^{\ell_{2}} \dots (\mathbf{H} - \varepsilon_{p} \mathbf{1})^{\ell_{p}} \text{ where: } \ell_{1} + \ell_{2} + \dots + \ell_{p} = N$$
  
The number  $\ell_{k}$  is called the *degree of degeneracy* of eigenvalue  $\varepsilon_{k}$ .

The minimum power integers  $\mu_k \leq \ell_k$ , that still make  $S(\mathbf{H}) = \mathbf{0}$ , form the *minimal equation (MEq)* of  $\mathbf{H}$ .  $\mathbf{0} = (-1)^N (\mathbf{H} - \boldsymbol{\varepsilon}_1 \mathbf{1})^{\mu_1} (\mathbf{H} - \boldsymbol{\varepsilon}_2 \mathbf{1})^{\mu_2} \dots (\mathbf{H} - \boldsymbol{\varepsilon}_p \mathbf{1})^{\mu_p}$  where:  $\mu_1 + \mu_2 + \dots + \mu_p = N_{MIN} \leq N$ 

If (and only if) just *one* ( $\mu_k = 1$ ) of each distinct factor is needed, then **H** is diagonalizable.  $\mathbf{0} = (-1)^N (\mathbf{H} - \boldsymbol{\varepsilon}_1 \mathbf{1})^1 (\mathbf{H} - \boldsymbol{\varepsilon}_2 \mathbf{1})^1 \dots (\mathbf{H} - \boldsymbol{\varepsilon}_p \mathbf{1})^1 \quad \text{where:} \quad p = N_{MIN} \leq N$  *Eigensolutions with degenerate eigenvalues (Possible?... or not?)* What if *secular equation* (*det*|M- $\varepsilon_j$ **1**|-0) of *N-by-N* matrix **H** has  $\ell$ -repeated  $\varepsilon_l$ -roots { $\varepsilon_{l_l}, \varepsilon_{l_2}... \varepsilon_{l_\ell}$ }?

If so, it's possible  $\mathbf{H}$  can't be completely diagonalized, though this is rarely the case. It all depends upon whether or not the *HC equation* really *needs* its repeated factors.

Suppose each eigenvalue  $\varepsilon_j$  is  $\ell_j$ -fold degenerate so *secular equation (SEq)* factors as follows:  $S(\varepsilon) = 0 = (-1)^N (\varepsilon - \varepsilon_1)^{\ell_1} (\varepsilon - \varepsilon_2)^{\ell_2} \dots (\varepsilon - \varepsilon_p)^{\ell_p} \text{ where: } \ell_1 + \ell_2 + \dots + \ell_p = N$ 

Then the *HC equation (HCeq)* is a matrix equation of degree *N* with **H** replacing  $\varepsilon$  in *SEq*:  $S(\varepsilon) \rightarrow S(\mathbf{H})$ 

$$S(\mathbf{H}) = \mathbf{0} = (-1)^{N} (\mathbf{H} - \varepsilon_{1} \mathbf{1})^{\ell_{1}} (\mathbf{H} - \varepsilon_{2} \mathbf{1})^{\ell_{2}} \dots (\mathbf{H} - \varepsilon_{p} \mathbf{1})^{\ell_{p}} \text{ where: } \ell_{1} + \ell_{2} + \dots + \ell_{p} = N$$
  
The number  $\ell_{k}$  is called the *degree of degeneracy* of eigenvalue  $\varepsilon_{k}$ .

The minimum power integers  $\mu_k \leq \ell_k$ , that still make  $S(\mathbf{H}) = \mathbf{0}$ , form the *minimal equation (MEq)* of  $\mathbf{H}$ .  $\mathbf{0} = (-1)^N (\mathbf{H} - \boldsymbol{\varepsilon}_1 \mathbf{1})^{\mu_1} (\mathbf{H} - \boldsymbol{\varepsilon}_2 \mathbf{1})^{\mu_2} \dots (\mathbf{H} - \boldsymbol{\varepsilon}_p \mathbf{1})^{\mu_p}$  where:  $\mu_1 + \mu_2 + \dots + \mu_p = N_{MIN} \leq N$ 

If (and only if) just *one* ( $\mu_k = 1$ ) of each distinct factor is needed, then **H** is diagonalizable.  $\mathbf{0} = (-1)^N \left(\mathbf{H} - \boldsymbol{\varepsilon}_1 \mathbf{1}\right)^1 \left(\mathbf{H} - \boldsymbol{\varepsilon}_2 \mathbf{1}\right)^1 \dots \left(\mathbf{H} - \boldsymbol{\varepsilon}_p \mathbf{1}\right)^1 \quad \text{where:} \quad p = N_{MIN} \leq N$   $\prod_{k \neq k} (\mathbf{M} - \boldsymbol{\varepsilon}_m \mathbf{1})$ 

This is true since this *p*-th degree equation spectrally decomposes **H** into *p* operators:  $\mathbf{P}_{\varepsilon_k} = \frac{\varepsilon_m \neq \varepsilon_k}{\prod (\varepsilon_k - \varepsilon_m)}$ 

*Eigensolutions with degenerate eigenvalues (Possible?... or not?)* What if *secular equation*  $(det|M-\varepsilon_j\mathbf{1}|-0)$  of *N-by-N* matrix **H** has  $\ell$ -repeated  $\varepsilon_l$ -roots  $\{\varepsilon_{l_l}, \varepsilon_{l_2}..., \varepsilon_{l_\ell}\}$ ?

If so, it's possible **H** can't be completely diagonalized, though this is rarely the case. It all depends upon whether or not the *HC equation* really *needs* its repeated factors.

Suppose each eigenvalue  $\varepsilon_j$  is  $\ell_j$ -fold degenerate so *secular equation (SEq)* factors as follows:  $S(\varepsilon) = 0 = (-1)^N (\varepsilon - \varepsilon_1)^{\ell_1} (\varepsilon - \varepsilon_2)^{\ell_2} \dots (\varepsilon - \varepsilon_p)^{\ell_p} \text{ where: } \ell_1 + \ell_2 + \dots + \ell_p = N$ 

Then the *HC equation (HCeq)* is a matrix equation of degree *N* with **H** replacing  $\varepsilon$  in *SEq*:  $S(\varepsilon) \rightarrow S(\mathbf{H})$ 

$$S(\mathbf{H}) = \mathbf{0} = (-1)^{N} (\mathbf{H} - \varepsilon_{1} \mathbf{1})^{\ell_{1}} (\mathbf{H} - \varepsilon_{2} \mathbf{1})^{\ell_{2}} \dots (\mathbf{H} - \varepsilon_{p} \mathbf{1})^{\ell_{p}} \text{ where: } \ell_{1} + \ell_{2} + \dots + \ell_{p} = N$$
  
The number  $\ell_{k}$  is called the *degree of degeneracy* of eigenvalue  $\varepsilon_{k}$ .

The minimum power integers  $\mu_k \leq \ell_k$ , that still make  $S(\mathbf{H}) = \mathbf{0}$ , form the *minimal equation (MEq)* of  $\mathbf{H}$ .  $\mathbf{0} = (-1)^N (\mathbf{H} - \varepsilon_1 \mathbf{1})^{\mu_1} (\mathbf{H} - \varepsilon_2 \mathbf{1})^{\mu_2} \dots (\mathbf{H} - \varepsilon_p \mathbf{1})^{\mu_p}$  where:  $\mu_1 + \mu_2 + \dots + \mu_p = N_{MIN} \leq N$ 

If (and only if) just *one* ( $\mu_k = 1$ ) of each distinct factor is needed, then **H** is diagonalizable.  $\mathbf{0} = (-1)^N \left(\mathbf{H} - \varepsilon_1 \mathbf{1}\right)^1 \left(\mathbf{H} - \varepsilon_2 \mathbf{1}\right)^1 \dots \left(\mathbf{H} - \varepsilon_p \mathbf{1}\right)^1 \quad \text{where:} \quad p = N_{MIN} \le N$   $\prod_{k=1}^{N} (\mathbf{M} - \varepsilon_m \mathbf{1})$ 

This is true since this *p*-th degree equation spectrally decomposes **H** into *p* operators:  $\mathbf{P}_{\varepsilon_k} = \frac{\varepsilon_m \neq \varepsilon_k}{\prod (\varepsilon_k - \varepsilon_m)}$ 

 $\mathbf{H} = \varepsilon_1 \mathbf{P}_{\varepsilon_1} + \varepsilon_2 \mathbf{P}_{\varepsilon_2} + \ldots + \varepsilon_p \mathbf{P}_{\varepsilon_p} \text{ that are ortho-complete: } \mathbf{P}_{\varepsilon_j} \mathbf{P}_{\varepsilon_k} = \delta_{jk} \mathbf{P}_{\varepsilon_k}$

Nilpotents and "Bad degeneracy" examples:  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ , and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ Applications of Nilpotent operators later on Idempotents and "Good degeneracy" example:  $\mathbf{G} = \begin{pmatrix} \cdots & 1 \\ \cdots & 1 \\ 1 & \cdots \end{pmatrix}$ Secular equation by minor expansion Example of minimal equation projection Orthonormalization of degenerate eigensolutions Projection  $\mathbf{P}_{j}$ -matrix anatomy (Gramian matrices) Gram-Schmidt procedure Orthonormalization of commuting eigensolutions. Examples:  $\mathbf{G} = \begin{bmatrix} \cdots & 1 \\ \cdots & 1 \\ 1 & \cdots \\ 1 & 1 \\ \cdots & 1 \end{bmatrix}$  and:  $\mathbf{H} = \begin{bmatrix} \cdots & 2 \\ 2 & \cdots & 2 \\ 1 & \cdots & 1 \end{pmatrix}$ Inte old "1=1.1 trick"-Spectral decomposition by projector splitting Irreducible projectors and representations (Trace checks) Minimal equation for projector  $\mathbf{P} = \mathbf{P}^2$  A *diagonalizability criterion* has just been proved:

In general, matrix **H** can make an ortho-complete set of  $\mathbf{P}_{\varepsilon_j}$  if and only if, the **H** minimal equation has no repeated factors. Then and only then is matrix **H** fully diagonalizable. A *diagonalizability criterion* has just been proved:

In general, matrix **H** can make an ortho-complete set of  $\mathbf{P}_{\mathcal{E}_j}$  if and only if, the **H** minimal equation has no repeated factors. Then and only then is matrix **H** fully diagonalizable.

If (and only if) just *one* ( $\mu_k = 1$ ) of each distinct factor is needed, then **H** is diagonalizable.  $\mathbf{0} = (-1)^N (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots (\mathbf{H} - \varepsilon_p \mathbf{1})^1 \quad \text{where:} \quad p = N_{MIN} \leq N$ since this *p*-th degree equation spectrally decomposes **H** into *p* operators:  $\mathbf{P}_{\varepsilon_k} = \prod_{\varepsilon_m \neq \varepsilon_k}^{m} (\mathbf{M} - \varepsilon_m \mathbf{1})$   $\mathbf{H} = \varepsilon_1 \mathbf{P}_{\varepsilon_1} + \varepsilon_2 \mathbf{P}_{\varepsilon_2} + \dots + \varepsilon_p \mathbf{P}_{\varepsilon_p}$  that are *orthonormal*:  $\mathbf{P}_{\varepsilon_j} \mathbf{P}_{\varepsilon_k} = \delta_{jk} \mathbf{P}_{\varepsilon_k}$ and *complete*:  $\mathbf{1} = \mathbf{P}_{\varepsilon_1} + \mathbf{P}_{\varepsilon_2} + \dots + \mathbf{P}_{\varepsilon_p}$ 

#### (Preparing for: Degenerate eigenvalues)

Review: matrix eigenstates ("ownstates) and Idempotent projectors (Degeneracy case) Operator orthonormality, completeness, and spectral decomposition (Degenerate e-values)

*Eigensolutions with degenerate eigenvalues (Possible?... or not?) Secular* → *Hamilton-Cayley* → *Minimal equations* Diagonalizability criterion

*Nilpotents and "Bad degeneracy" examples:*  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ , and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ Applications of Nilpotent operators later on

*Idempotents and "Good degeneracy" example:*  $\mathbf{G} = \begin{bmatrix} \vdots & \vdots & 1 \\ \vdots & 1 & \vdots \\ \vdots & 1 & \vdots \end{bmatrix}$ Secular equation by minor expansion *Example of minimal equation projection* Orthonormalization of degenerate eigensolutions *Projection* **P**<sub>*i*</sub>*-matrix anatomy (Gramian matrices)* Gram-Schmidt procedure

Orthonormalization of commuting eigensolutions. Examples:  $\mathbf{G} = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$  and:  $\mathbf{H} = \begin{bmatrix} 1 & 2 & 1 \\ 2 & 1 & 2 \\ 2 & 1 & 2 \end{bmatrix}$ The old "1=1.1 trick"-Spectral decomposition by projector splitting *Irreducible projectors and representations (Trace checks) Minimal equation for projector* **P**=**P**<sup>2</sup>

*Nilpotents and "Bad degeneracy" examples:*  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ , and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ 

*Repeated minimal equation factors* means you will not get an ortho-complete set of  $P_j$ . Even *one repeat* is fatal...

 $\mathbf{0} = \left(\mathbf{H} - \boldsymbol{\varepsilon}_1 \mathbf{1}\right)^2 \left(\mathbf{H} - \boldsymbol{\varepsilon}_2 \mathbf{1}\right)^1 \dots,$ 

Nilpotents and "Bad degeneracy" examples: 
$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
, and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
Repeated minimal equation factors means you will not get an ortho-complete set of Pj.  
Even one repeat is fatal... when removal of repeated ( $\mathbf{H} - \varepsilon_1 \mathbf{1}$ ) gives a *non-zero* operator N.

$$\mathbf{0} = \left(\mathbf{H} - \boldsymbol{\varepsilon}_1 \mathbf{1}\right)^2 \left(\mathbf{H} - \boldsymbol{\varepsilon}_2 \mathbf{1}\right)^1 \dots, \text{ but: } \mathbf{N} = \left(\mathbf{H} - \boldsymbol{\varepsilon}_1 \mathbf{1}\right)^1 \left(\mathbf{H} - \boldsymbol{\varepsilon}_2 \mathbf{1}\right)^1 \dots \neq \mathbf{0} \longleftarrow$$

Nilpotents and "Bad degeneracy" examples: 
$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
, and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
Repeated minimal equation factors means you will not get an ortho-complete set of P<sub>j</sub>.  
Even: one repeat is fatal... when removal of repeated ( $\mathbf{H} - \varepsilon_1 \mathbf{1}$ ) gives a non-zero operator N.  
(like this )  
 $\mathbf{0} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ 

Then squaring N puts back the missing  $(H-\varepsilon_1)$ -factor that completes the zero minimal equation.

$$\mathbf{N}^2 = \left(\mathbf{H} - \boldsymbol{\varepsilon}_1 \mathbf{1}\right)^2 \left(\mathbf{H} - \boldsymbol{\varepsilon}_2 \mathbf{1}\right)^2 \dots = \mathbf{0}$$

Nilpotents and "Bad degeneracy" examples: 
$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
, and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
Repeated minimal equation factors means you will not get an ortho-complete set of P<sub>j</sub>.  
Even: one repeat is fatal... when removal of repeated ( $\mathbf{H} - \varepsilon_1 \mathbf{1}$ ) gives a non-zero operator N.  
 $\mathbf{O} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{O}$ 

Then squaring N puts back the missing  $(\mathbf{H} - \varepsilon_1 \mathbf{1})$ -factor that completes the zero minimal equation. (The other extra  $(\mathbf{H} - \varepsilon_2 \mathbf{1})$ )... factors cannot keep N<sup>2</sup> from being zero.)

*Nilpotents and "Bad degeneracy" examples:* 
$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
, and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
*Repeated minimal equation factors* means you will not get an ortho-complete set of **P**<sub>j</sub>.  
Even *one repeat* is fatal... when removal of repeated ( $\mathbf{H} - \varepsilon_1 \mathbf{1}$ ) gives a *non-zero* operator **N**.  
(like this  $\downarrow$ )  
 $\mathbf{0} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ 

Then squaring N puts back the missing  $(\mathbf{H} - \varepsilon_1 \mathbf{1})$ -factor that completes the zero minimal equation. (The other extra  $(\mathbf{H} - \varepsilon_2 \mathbf{1})$ )... factors cannot keep N<sup>2</sup> from being zero.)

Such an operator is called a *nilpotent operator* or, simply a *nilpotent*.

Nilpotents and "Bad degeneracy" examples: 
$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
, and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
Repeated minimal equation factors means you will not get an ortho-complete set of Pj.  
Even: one repeat is fatal... when removal of repeated ( $\mathbf{H} - \varepsilon_1 \mathbf{1}$ ) gives a non-zero operator N.  
 $\mathbf{U} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ 

Then squaring N puts back the missing  $(\mathbf{H} - \varepsilon_1 \mathbf{1})$ -factor that completes the zero minimal equation. (The other extra  $(\mathbf{H} - \varepsilon_2 \mathbf{1})$ .... factors cannot keep N<sup>2</sup> from being zero.)  $N^2 = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^2 \dots = \mathbf{0}$ *Order-2 Nilpotent*: Non-zero N whose square N<sup>2</sup> is zero.

Such an operator is called a *nilpotent operator* or, simply a *nilpotent*.

Nilpotents and "Bad degeneracy" examples: 
$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
, and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
Repeated minimal equation factors means you will not get an ortho-complete set of Pj.  
Even: one repeat is fatal... when removal of repeated  $(\mathbf{H} - \varepsilon_1 \mathbf{1})$  gives a non-zero operator N.  
 $\mathbf{U} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ 

Then squaring N puts back the missing  $(\mathbf{H} - \varepsilon_1 \mathbf{1})$ -factor that completes the zero minimal equation. (The other extra  $(\mathbf{H} - \varepsilon_2 \mathbf{1})$ ... factors cannot keep N<sup>2</sup> from being zero.) Order-2 Nilpotent: Non-zero N whose square N<sup>2</sup> is zero.

Such an operator is called a *nilpotent operator* or, simply a *nilpotent*. A nilpotent is a troublesome *bete noir* for basic diagonalization, but a key feature of Non-Abelian symmetry analysis.
Nilpotents and "Bad degeneracy" examples: 
$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
, and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
Repeated minimal equation factors means you will not get an ortho-complete set of Pj.  
Even: one repeat is fatal... when removal of repeated ( $\mathbf{H} - \varepsilon_1 \mathbf{1}$ ) gives a non-zero operator N.  
 $\mathbf{O} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ 

Such an operator is called a *nilpotent operator* or, simply a *nilpotent*. A nilpotent is a troublesome *bete noir* for basic diagonalization, but a key feature of Non-Abelian symmetry analysis.

$$\mathbf{B} = \left(\begin{array}{cc} b & 1 \\ 0 & b \end{array}\right)$$

Nilpotents and "Bad degeneracy" examples: 
$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
, and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
Repeated minimal equation factors means you will not get an ortho-complete set of Pj.  
Even: one repeat is fatal... when removal of repeated  $(\mathbf{H} - \varepsilon_1 \mathbf{1})$  gives a non-zero operator N.  
 $\mathbf{O} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ 

Such an operator is called a *nilpotent operator* or, simply a *nilpotent*. A nilpotent is a troublesome *bete noir* for basic diagonalization, but a key feature of Non-Abelian symmetry analysis.

For example, consider a 'bad' degenerate matrix. (...not just a "bad cop" but a real "*crook*"!)

 $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ -Trace(**B**) + Det|**B**| Secular equation has two equal roots ( $\varepsilon = b$  twice):  $S(\varepsilon) = \varepsilon^2 - 2b\varepsilon + b^2 = (\varepsilon - b)^2 = 0$ 

Nilpotents and "Bad degeneracy" examples: 
$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
, and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
Repeated minimal equation factors means you will not get an ortho-complete set of Pj.  
Even one repeat is fatal... when removal of repeated  $(\mathbf{H} - \varepsilon_1 \mathbf{1})$  gives a *non-zero* operator N.  
 $\mathbf{0} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ 

Such an operator is called a *nilpotent operator* or, simply a *nilpotent*. A nilpotent is a troublesome *bete noir* for basic diagonalization, but a key feature of Non-Abelian symmetry analysis.

For example, consider a 'bad' degenerate matrix. (...not just a "bad cop" but a real "*crook*"!)

 $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ -Trace(**B**) +Det|**B**| Secular equation has two equal roots ( $\varepsilon = b$  twice):  $S(\varepsilon) = \varepsilon^2 - 2b\varepsilon + b^2 = (\varepsilon - b)^2 = 0$ This gives *HC* equation:  $S(\mathbf{B}) = \mathbf{B}^2 - 2b\mathbf{B} + b^2\mathbf{1} = (\mathbf{B} - b\mathbf{1})^2 = \mathbf{0} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}^2$ 

Nilpotents and "Bad degeneracy" examples: 
$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
, and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
Repeated minimal equation factors means you will not get an ortho-complete set of Pj.  
Even: one repeat is fatal... when removal of repeated  $(\mathbf{H} - \varepsilon_1 \mathbf{1})$  gives a non-zero operator N.  
 $\mathbf{0} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ 

Such an operator is called a *nilpotent operator* or, simply a *nilpotent*. A nilpotent is a troublesome *bete noir* for basic diagonalization, but a key feature of Non-Abelian symmetry analysis.

$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
-Trace(**B**) +Det|**B**|  
Secular equation has two equal roots ( $\varepsilon = b$  twice):  $S(\varepsilon) = \varepsilon^2 - 2b\varepsilon + b^2 = (\varepsilon - b)^2 = 0$   
This gives *HC equation*:  $S(\mathbf{B}) = \mathbf{B}^2 - 2b\mathbf{B} + b^2\mathbf{1} = (\mathbf{B} - b\mathbf{1})^2 = \mathbf{0} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}^2$   
This in turn gives a  
nilpotent eigen-projector:  $\mathbf{N} = \mathbf{B} - b\mathbf{1} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ 

Nilpotents and "Bad degeneracy" examples:  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ , and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ Repeated minimal equation factors means you will not get an ortho-complete set of Pj. Even one repeat is fatal... when removal of repeated ( $\mathbf{H} - \varepsilon_1 \mathbf{1}$ ) gives a *non-zero* operator N. (like this  $\downarrow$ )  $\mathbf{0} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 \cdot (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ 

Then squaring N puts back the missing  $(\mathbf{H} - \varepsilon_1 \mathbf{1})$ -factor that completes the zero minimal equation. (The other extra  $(\mathbf{H} - \varepsilon_2 \mathbf{1})$ .... factors cannot keep N<sup>2</sup> from being zero.) Order-2 Nilpotent: Non-zero N whose square N<sup>2</sup> is zero.

Such an operator is called a *nilpotent operator* or, simply a *nilpotent*. A nilpotent is a troublesome *bete noir* for basic diagonalization, but a key feature of Non-Abelian symmetry analysis.

$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
-Trace(**B**) +Det|**B**|  
Secular equation has two equal roots ( $\varepsilon = b$  twice):  $S(\varepsilon) = \varepsilon^2 - 2b\varepsilon + b^2 = (\varepsilon - b)^2 = 0$   
This gives *HC equation*:  $S(\mathbf{B}) = \mathbf{B}^2 - 2b\mathbf{B} + b^2\mathbf{1} = (\mathbf{B} - b\mathbf{1})^2 = \mathbf{0} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}^2$   
This in turn gives a  
nilpotent eigen-projector:  $\mathbf{N} = \mathbf{B} - b\mathbf{1} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
...which satisfies:  $\mathbf{N}^2 = \mathbf{0}$  (but  $\mathbf{N} \neq \mathbf{0}$ ) and:  $\mathbf{BN} = b\mathbf{N} = \mathbf{NB}$ 

Nilpotents and "Bad degeneracy" examples:  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ , and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ Repeated minimal equation factors means you will not get an ortho-complete set of **P**<sub>j</sub>. Even: one repeat is fatal... when removal of repeated  $(\mathbf{H} - \varepsilon_1 \mathbf{1})$  gives a non-zero operator **N**.  $\mathbf{0} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ Then squaring **N** puts back the missing  $(\mathbf{H} - \varepsilon_1 \mathbf{1})$ -factor that completes the zero minimal equation.

$$\mathbf{N}^2 = \left(\mathbf{H} - \boldsymbol{\varepsilon}_1 \mathbf{1}\right)^2 \left(\mathbf{H} - \boldsymbol{\varepsilon}_2 \mathbf{1}\right)^2 \dots = \mathbf{0}$$

*Order-2 Nilpotent*: <u>Non</u>-zero **N** whose square  $N^2$  is zero.

(The other extra  $(\mathbf{H}-\varepsilon_2 \mathbf{1})$ )... factors

cannot keep  $N^2$  from being zero.)

Such an operator is called a *nilpotent operator* or, simply a *nilpotent*. A nilpotent is a troublesome *bete noir* for basic diagonalization, but a key feature of Non-Abelian symmetry analysis.

$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
-Trace(**B**) +Det|**B**|  
Secular equation has two equal roots ( $\varepsilon = b$  twice):  $S(\varepsilon) = \varepsilon^2 - 2b\varepsilon + b^2 = (\varepsilon - b)^2 = 0$   
This gives *HC equation*:  $S(\mathbf{B}) = \mathbf{B}^2 - 2b\mathbf{B} + b^2\mathbf{1} = (\mathbf{B} - b\mathbf{1})^2 = \mathbf{0} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}^2$   
This in turn gives a  
nilpotent eigen-projector:  $\mathbf{N} = \mathbf{B} - b\mathbf{1} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
...which satisfies:  $\mathbf{N}^2 = \mathbf{0}$  (but  $\mathbf{N} \neq \mathbf{0}$ ) and:  $\mathbf{BN} = b\mathbf{N} = \mathbf{NB}$   
This nilpotent **N** contains only one non-zero eigenket and one eigenbra.  $|b\rangle = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$ ,  $\langle b| = \begin{pmatrix} 0 & 1 \end{pmatrix}$ 

Nilpotents and "Bad degeneracy" examples:  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ , and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ Repeated minimal equation factors means you will not get an ortho-complete set of Pj. Even one repeat is fatal... when removal of repeated ( $\mathbf{H} \cdot \varepsilon_1 \mathbf{1}$ ) gives a non-zero operator N.  $\mathbf{0} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ Then squaring N puts back the missing ( $\mathbf{H} \cdot \varepsilon_1 \mathbf{1}$ )-factor that completes the zero minimal equation. (The other extra ( $\mathbf{H} \cdot \varepsilon_2 \mathbf{1}$ )... factors

$$\mathbf{N}^2 = \left(\mathbf{H} - \boldsymbol{\varepsilon}_1 \mathbf{1}\right)^2 \left(\mathbf{H} - \boldsymbol{\varepsilon}_2 \mathbf{1}\right)^2 \dots = \mathbf{0}$$

*Order-2 Nilpotent*: <u>Non</u>-zero N whose square  $N^2$  is zero.

cannot keep  $N^2$  from being zero.)

Such an operator is called a *nilpotent operator* or, simply a *nilpotent*. A nilpotent is a troublesome *bete noir* for basic diagonalization, but a key feature of Non-Abelian symmetry analysis.

For example, consider a 'bad' degenerate matrix. (...not just a "bad cop" but a real "*crook*"!)

$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
-Trace(**B**) +Det|**B**|  
Secular equation has two equal roots ( $\varepsilon = b$  twice):  $S(\varepsilon) = \varepsilon^2 - 2b\varepsilon + b^2 = (\varepsilon - b)^2 = 0$   
This gives *HC equation*:  $S(\mathbf{B}) = \mathbf{B}^2 - 2b\mathbf{B} + b^2\mathbf{1} = (\mathbf{B} - b\mathbf{1})^2 = \mathbf{0} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}^2$   
This in turn gives a  
nilpotent eigen-projector:  $\mathbf{N} = \mathbf{B} - b\mathbf{1} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
...which satisfies:  $\mathbf{N}^2 = \mathbf{0}$  (but  $\mathbf{N} \neq \mathbf{0}$ ) and:  $\mathbf{BN} = b\mathbf{N} = \mathbf{NB}$   
This nilpotent **N** contains only one non-zero eigenket and one eigenbra.  $|b\rangle = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$ ,  $\langle b| = \begin{pmatrix} 0 & 1 \\ 0 \end{pmatrix}$   
hese two have zero-norm!  $(\langle b|b\rangle = \mathbf{0})$ 

Thursday, January 22, 2015

Nilpotents and "Bad degeneracy" examples:  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ , and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ Repeated minimal equation factors means you will not get an ortho-complete set of Pj. Even one repeat is fatal... when removal of repeated ( $\mathbf{H} - \varepsilon_1 \mathbf{1}$ ) gives a non-zero operator N.  $\mathbf{0} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^2 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots$ , but:  $\mathbf{N} = (\mathbf{H} - \varepsilon_1 \mathbf{1})^1 (\mathbf{H} - \varepsilon_2 \mathbf{1})^1 \dots \neq \mathbf{0}$ Then squaring N puts back the missing ( $\mathbf{H} - \varepsilon_1 \mathbf{1}$ )-factor that completes the zero minimal equation. Such an operator is called a *nilpotent operator* or, simply a *nilpotent*. A nilpotent is a troublesome *bete noir* for basic diagonalization, but a key feature of Non-Abelian symmetry analysis.

$$\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$$
-Trace(**B**) +Det[**B**]  
Secular equation has two equal roots ( $\varepsilon = b$  twice):  $S(\varepsilon) = \varepsilon^2 - 2b\varepsilon + b^2 = (\varepsilon - b)^2 = 0$   
This gives *HC equation*:  $S(\mathbf{B}) = \mathbf{B}^2 - 2b\mathbf{B} + b^2\mathbf{1} = (\mathbf{B} - b\mathbf{1})^2 = \mathbf{0} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}^2$   
This in turn gives a  
nilpotent eigen-projector:  $\mathbf{N} = \mathbf{B} - b\mathbf{1} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$   
...which satisfies:  $\mathbf{N}^2 = \mathbf{0}$  (but  $\mathbf{N} \neq \mathbf{0}$ ) and:  $\mathbf{BN} = b\mathbf{N} = \mathbf{NB}$   
This nilpotent **N** contains only one non-zero eigenket and one eigenbra.  $|b\rangle = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$ ,  $\langle b| = \begin{pmatrix} 0 & 1 \end{pmatrix}$   
These two have zero-norm! ( $\langle b|b\rangle = 0$ ) The usual idempotent spectral resolution is no-go.

#### (Preparing for: Degenerate eigenvalues)

Review: matrix eigenstates ("ownstates) and Idempotent projectors (Degeneracy case) Operator orthonormality, completeness, and spectral decomposition (Degenerate e-values)

*Eigensolutions with degenerate eigenvalues (Possible?... or not?) Secular* → *Hamilton-Cayley* → *Minimal equations* Diagonalizability criterion

Nilpotents and "Bad degeneracy" examples:  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ , and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ Applications of Nilpotent operators later on

Example of minimal equation projection Orthonormalization of degenerate eigensolutions *Projection* **P**<sub>*i*</sub>*-matrix anatomy (Gramian matrices)* Gram-Schmidt procedure

Orthonormalization of commuting eigensolutions. Examples:  $\mathbf{G} = \begin{bmatrix} \cdots & 1 & 1 \\ \cdots & 1 & \cdots \\ 1 & 1 & \cdots \end{bmatrix}$  and:  $\mathbf{H} = \begin{bmatrix} \cdots & 2 & 1 \\ \cdots & 2 & 2 \\ 2 & \cdots & 2 \\ 2 & \cdots & 1 \end{bmatrix}$ The old "1=1.1 trick"-Spectral decomposition by projector splitting *Irreducible projectors and representations (Trace checks) Minimal equation for projector* **P**=**P**<sup>2</sup>

As shown later, nilpotents or other "bad" matrices are valuable for quantum theory.

 $N = |1\rangle\langle 2|$  is an example of an *elementary operator*  $\mathbf{e}_{ab} = |a\rangle\langle b|$ 

As shown later, nilpotents or other "bad" matrices are valuable for quantum theory.

 $\mathbf{N} = |1\rangle\langle 2|$  is an example of an *elementary operator*  $\mathbf{e}_{ab} = |a\rangle\langle b|$ 

**N** and its partners comprise a 4-dimensional U(2) unit tensor operator space

$$U(2) \text{ op-space} = \{ \mathbf{e}_{11} = |1\rangle\langle 1|, \quad \mathbf{e}_{12} = |1\rangle\langle 2|, \quad \mathbf{e}_{21} = |2\rangle\langle 1|, \quad \mathbf{e}_{22} = |2\rangle\langle 2| \}$$
$$\langle \mathbf{e}_{11} \rangle = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}, \quad \langle \mathbf{e}_{12} \rangle = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}, \quad \langle \mathbf{e}_{21} \rangle = \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix}, \quad \langle \mathbf{e}_{22} \rangle = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix},$$

They form an *elementary matrix algebra*  $\mathbf{e}_{ij} \mathbf{e}_{km} = \delta_{jk} \mathbf{e}_{im}$  of unit tensor operators. The non-diagonal ones are non-diagonalizable *nilpotent* operators As shown later, nilpotents or other "bad" matrices are valuable for quantum theory.

 $\mathbf{N} = |1\rangle\langle 2|$  is an example of an *elementary operator*  $\mathbf{e}_{ab} = |a\rangle\langle b|$ 

N and its partners comprise a 4-dimensional U(2) unit tensor operator space

$$U(2) \text{ op-space} = \{ \mathbf{e}_{11} = |1\rangle\langle 1|, \quad \mathbf{e}_{12} = |1\rangle\langle 2|, \quad \mathbf{e}_{21} = |2\rangle\langle 1|, \quad \mathbf{e}_{22} = |2\rangle\langle 2| \}$$
$$\langle \mathbf{e}_{11} \rangle = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix}, \quad \langle \mathbf{e}_{12} \rangle = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}, \quad \langle \mathbf{e}_{21} \rangle = \begin{pmatrix} 0 & 0 \\ 1 & 0 \end{pmatrix}, \quad \langle \mathbf{e}_{22} \rangle = \begin{pmatrix} 0 & 0 \\ 0 & 1 \end{pmatrix},$$

They form an *elementary matrix algebra*  $\mathbf{e}_{ij} \mathbf{e}_{km} = \delta_{jk} \mathbf{e}_{im}$  of unit tensor operators. The non-diagonal ones are non-diagonalizable *nilpotent* operators

Their  $\infty$ -Dimensional cousins are the *creation-destruction*  $\mathbf{a}_i^{\dagger} \mathbf{a}_j$  operators.

Yet G satisfies *Minimal Equation (MinEq)* of only 2<sup>nd</sup> degree with no repeats.

0 = (G - 1) (G + 1)

An example of a 'good' degenerate (but still diagonalizable) matrix is the anti-diagonal "gamma" matrix **G** (*a Dirac-Lorentz transform generator*)

$$\mathbf{G} = \begin{pmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{pmatrix} \qquad \qquad \mathbf{SEq:} \qquad \mathbf{S}(\varepsilon) = \det |\mathbf{G} - \varepsilon \mathbf{1}| = \det \begin{vmatrix} -\varepsilon & 0 & 0 & 1 \\ 0 & -\varepsilon & 1 & 0 \\ 0 & 1 & -\varepsilon & 0 \\ 1 & 0 & 0 & -\varepsilon \end{vmatrix}$$

 $\varepsilon$  has a 4<sup>th</sup> degree *Secular Equation (SEq)* with repeat pairs of degenerate roots ( $\varepsilon_k = \pm 1$ )  $S(\varepsilon) = 0 = \varepsilon^4 - 2\varepsilon^2 + 1 = (\varepsilon - 1)^2 (\varepsilon + 1)^2$ 

**G** has a 4<sup>th</sup> degree *HC equation* (*HCeq*) with **G** replacing  $\varepsilon$  in  $SEq: S(\varepsilon) \to S(G)$ 

$$S(\mathbf{G}) = 0 = \mathbf{G}^4 - 2\mathbf{G}^2 + 1 = (\mathbf{G} - 1)^2 (\mathbf{G} + 1)$$

Yet **G** satisfies *Minimal Equation (MinEq)* of only  $2^{nd}$  degree with no repeats. So  $P_{\varepsilon_k}$  formulae work!

$$0 = (G - 1) (G + 1)$$

$$\mathbf{P}_{\varepsilon_{k}} = \frac{\prod_{\varepsilon_{m} \neq \varepsilon_{k}} (\mathbf{M} - \varepsilon_{m} \mathbf{1})}{\prod_{\varepsilon_{m} \neq \varepsilon_{k}} (\varepsilon_{k} - \varepsilon_{m})}$$

An example of a 'good' degenerate (but still diagonalizable) matrix is the anti-diagonal "gamma" matrix **G** (*a Dirac-Lorentz transform generator*)

$$\mathbf{G} = \begin{pmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{pmatrix} \qquad \qquad \mathbf{SEq:} \qquad \mathbf{S}(\varepsilon) = \det |\mathbf{G} - \varepsilon \mathbf{1}| = \det \begin{vmatrix} -\varepsilon & 0 & 0 & 1 \\ 0 & -\varepsilon & 1 & 0 \\ 0 & 1 & -\varepsilon & 0 \\ 1 & 0 & 0 & -\varepsilon \end{vmatrix}$$

 $\varepsilon$  has a 4<sup>th</sup> degree *Secular Equation (SEq)* with repeat pairs of degenerate roots ( $\varepsilon_k = \pm 1$ )  $S(\varepsilon) = 0 = \varepsilon^4 - 2\varepsilon^2 + 1 = (\varepsilon - 1)^2 (\varepsilon + 1)^2$ 

**G** has a 4<sup>th</sup> degree *HC equation* (*HCeq*) with **G** replacing  $\varepsilon$  in  $SEq: S(\varepsilon) \to S(\mathbf{G})$ 

$$S(\mathbf{G}) = 0 = \mathbf{G}^4 - 2\mathbf{G}^2 + 1 = (\mathbf{G} - 1)^2 (\mathbf{G} + 1)^2$$

Yet G satisfies *Minimal Equation (MinEq)* of only  $2^{nd}$  degree with no repeats. So  $P_{\varepsilon_k}$  formulae work!

0 = (G - 1) (G + 1)

Two ortho-complete projection operators are derived by Projection formula:  $\mathbf{P}_{\varepsilon_k} = \frac{\varepsilon_m \neq \varepsilon_k}{\prod (\varepsilon_k - \dot{\varepsilon}_m)}$ 

$$\mathbf{P}_{+1}^{G} = \frac{\mathbf{G} - (-1)\mathbf{1}}{+1 - (-1)} = \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{pmatrix} \qquad \qquad \mathbf{P}_{-1}^{G} = \frac{\mathbf{G} - (1)\mathbf{1}}{-1 - (1)} = \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & -1 \\ 0 & 1 & -1 & 0 \\ 0 & -1 & 1 & 0 \\ -1 & 0 & 0 & 1 \end{pmatrix}$$

An example of a 'good' degenerate (but still diagonalizable) matrix is the anti-diagonal "gamma" matrix **G** (*a Dirac-Lorentz transform generator*)

$$\mathbf{G} = \begin{pmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{pmatrix} \qquad \qquad \mathbf{SEq:} \qquad \mathbf{S}(\varepsilon) = \det |\mathbf{G} - \varepsilon \mathbf{1}| = \det \begin{vmatrix} -\varepsilon & 0 & 0 & 1 \\ 0 & -\varepsilon & 1 & 0 \\ 0 & 1 & -\varepsilon & 0 \\ 1 & 0 & 0 & -\varepsilon \end{vmatrix}$$

 $\varepsilon$  has a 4<sup>th</sup> degree *Secular Equation (SEq)* with repeat pairs of degenerate roots ( $\varepsilon_k = \pm 1$ )  $S(\varepsilon) = 0 = \varepsilon^4 - 2\varepsilon^2 + 1 = (\varepsilon - 1)^2 (\varepsilon + 1)^2$ 

**G** has a 4<sup>th</sup> degree *HC equation* (*HCeq*) with **G** replacing  $\varepsilon$  in  $SEq: S(\varepsilon) \to S(G)$ 

$$S(\mathbf{G}) = 0 = \mathbf{G}^4 - 2\mathbf{G}^2 + 1 = (\mathbf{G} - 1)^2 (\mathbf{G} + 1)^2$$

Yet G satisfies *Minimal Equation (MinEq)* of only 2<sup>nd</sup> degree with no repeats. So  $P_{\varepsilon_k}$  formulae work!

$$0 = (G - 1) (G + 1)$$

Two ortho-complete projection operators are derived by Projection formula:  $\mathbf{P}_{\varepsilon_k} = \frac{\varepsilon_m \neq \varepsilon_k}{\prod (\varepsilon_k - \varepsilon_m)}$ 

$$\mathbf{P}_{+1}^{G} = \frac{\mathbf{G} - (-1)\mathbf{1}}{+1 - (-1)} = \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{pmatrix} \qquad \mathbf{P}_{-1}^{G} = \frac{\mathbf{G} - (1)\mathbf{1}}{-1 - (1)} = \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & -1 \\ 0 & 1 & -1 & 0 \\ 0 & -1 & 1 & 0 \\ -1 & 0 & 0 & 1 \end{pmatrix}$$
  
Each of these projectors contains two linearly independent ket or bra vectors:

$$|1_{1}\rangle = \frac{|1_{1}\rangle}{\sqrt{2}} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1\\0\\0\\1 \end{pmatrix} |1_{2}\rangle = \frac{|1_{2}\rangle}{\sqrt{2}} = \frac{1}{\sqrt{2}} \begin{pmatrix} 0\\1\\1\\0 \end{pmatrix} |-1_{1}\rangle = \frac{|-1_{1}\rangle}{\sqrt{2}} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1\\0\\0\\-1 \end{pmatrix} |-1_{2}\rangle = \frac{|-1_{2}\rangle}{\sqrt{2}} = \frac{1}{\sqrt{2}} \begin{pmatrix} 0\\1\\-1\\0 \end{pmatrix} |$$

# *Idempotents and "Good degeneracy" example:* $\mathbf{G} = \begin{bmatrix} \vdots & \vdots & 1 \\ \vdots & 1 & \vdots \\ \vdots & 1 & \ddots \end{bmatrix}$

An example of a 'good' degenerate (but still diagonalizable) matrix is the anti-diagonal "gamma" matrix **G** (*a Dirac-Lorentz transform generator*)

 $\mathbf{G} = \begin{pmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{pmatrix} \qquad \qquad \mathbf{SEq:} \qquad \mathbf{S}(\varepsilon) = \det |\mathbf{G} - \varepsilon \mathbf{1}| = \det \begin{vmatrix} -\varepsilon & 0 & 0 & 1 \\ 0 & -\varepsilon & 1 & 0 \\ 0 & 1 & -\varepsilon & 0 \\ 1 & 0 & 0 & -\varepsilon \end{vmatrix}$ 

 $\varepsilon$  has a 4<sup>th</sup> degree *Secular Equation (SEq)* with repeat pairs of degenerate roots ( $\varepsilon_k = \pm 1$ )  $S(\varepsilon) = 0 = \varepsilon^4 - 2\varepsilon^2 + 1 = (\varepsilon - 1)^2 (\varepsilon + 1)^2$ 

**G** has a 4<sup>th</sup> degree *HC equation* (*HCeq*) with **G** replacing  $\varepsilon$  in *SEq*:  $S(\varepsilon) \rightarrow S(\mathbf{G})$ 

$$S(\mathbf{G}) = 0 = \mathbf{G}^4 - 2\mathbf{G}^2 + 1 = (\mathbf{G} - 1)^2 (\mathbf{G} + 1)^2$$

Yet G satisfies *Minimal Equation (MinEq)* of only  $2^{nd}$  degree with no repeats. So  $P_{\varepsilon_k}$  formulae work!

$$0 = (G - 1) (G + 1)$$

Two ortho-complete projection operators are derived by Projection formula:  $\mathbf{P}_{\varepsilon_k} = \frac{\overline{\varepsilon_m \neq \varepsilon_k}}{\prod (\varepsilon_k - \varepsilon_m)}$ 

$$\mathbf{P}_{+1}^{G} = \frac{\mathbf{G} - (-1)\mathbf{1}}{+1 - (-1)} = \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{pmatrix} \qquad \qquad \mathbf{P}_{-1}^{G} = \frac{\mathbf{G} - (1)\mathbf{1}}{-1 - (1)} = \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & -1 \\ 0 & 1 & -1 & 0 \\ 0 & -1 & 1 & 0 \\ -1 & 0 & 0 & 1 \end{pmatrix}$$

Each of these projectors contains two linearly independent ket or bra vectors:

$$|1_{1}\rangle = \frac{|1_{1}\rangle}{\sqrt{2}} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1\\0\\0\\1 \end{pmatrix} |1_{2}\rangle = \frac{|1_{2}\rangle}{\sqrt{2}} = \frac{1}{\sqrt{2}} \begin{pmatrix} 0\\1\\1\\0 \end{pmatrix} |-1_{1}\rangle = \frac{|-1_{1}\rangle}{\sqrt{2}} = \frac{1}{\sqrt{2}} \begin{pmatrix} 1\\0\\0\\-1 \end{pmatrix} |-1_{2}\rangle = \frac{|-1_{2}\rangle}{\sqrt{2}} = \frac{1}{\sqrt{2}} \begin{pmatrix} 0\\1\\-1\\0 \end{pmatrix}$$
These 4 are more than linearly independent... in they are orthogonal.

An example of a 'good' degenerate (but still diagonalizable) matrix is the anti-diagonal "gamma" matrix **G** (*a Dirac-Lorentz transform generator*)

$$\mathbf{G} = \begin{pmatrix} 0 & 0 & 0 & 1 \\ 0 & 0 & 1 & 0 \\ 0 & 1 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{pmatrix} \qquad \qquad \mathbf{SEq:} \qquad \mathbf{S}(\varepsilon) = \det |\mathbf{G} - \varepsilon \mathbf{1}| = \det \begin{vmatrix} -\varepsilon & 0 & 0 & 1 \\ 0 & -\varepsilon & 1 & 0 \\ 0 & 1 & -\varepsilon & 0 \\ 1 & 0 & 0 & -\varepsilon \end{vmatrix}$$

 $\varepsilon$  has a 4<sup>th</sup> degree *Secular Equation (SEq)* with repeat pairs of degenerate roots ( $\varepsilon_k = \pm 1$ )  $S(\varepsilon) = 0 = \varepsilon^4 - 2\varepsilon^2 + 1 = (\varepsilon - 1)^2 (\varepsilon + 1)^2$ 

**G** has a 4<sup>th</sup> degree *HC equation* (*HCeq*) with **G** replacing  $\varepsilon$  in  $SEq: S(\varepsilon) \to S(G)$ 

$$S(\mathbf{G}) = 0 = \mathbf{G}^4 - 2\mathbf{G}^2 + 1 = (\mathbf{G} - 1)^2 (\mathbf{G} + 1)^2$$

Yet G satisfies *Minimal Equation (MinEq)* of only 2<sup>nd</sup> degree with no repeats. So  $P_{\varepsilon_k}$  formulae work!

$$0 = (G - 1) (G + 1)$$

Two ortho-complete projection operators are derived by Projection formula:  $\mathbf{P}_{\varepsilon_k} = \frac{\varepsilon_m \neq \varepsilon_k}{\prod (\varepsilon_k - \varepsilon_m)}$ 

$$\mathbf{P}_{+1}^{G} = \frac{\mathbf{G} - (-1)\mathbf{1}}{+1 - (-1)} = \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & 1 \\ 0 & 1 & 1 & 0 \\ 0 & 1 & 1 & 0 \\ 1 & 0 & 0 & 1 \end{pmatrix} \qquad \mathbf{P}_{-1}^{G} = \frac{\mathbf{G} - (1)\mathbf{1}}{-1 - (1)} = \frac{1}{2} \begin{pmatrix} 1 & 0 & 0 & -1 \\ 0 & 1 & -1 & 0 \\ 0 & -1 & 1 & 0 \\ -1 & 0 & 0 & 1 \end{pmatrix}$$
  
Each of these projectors contains two linearly independent ket or bra vectors:  
$$|\mathbf{1}_{1}\rangle \underbrace{\mathbf{Bra} - Ket \ repeats \ may \ need \ to \ be \ made \ orthogonal. Two \ methods \ shown \ next: independent...}$$

(Preparing for: Degenerate eigenvalues)

Review: matrix eigenstates ("ownstates) and Idempotent projectors (Degeneracy case) Operator orthonormality, completeness, and spectral decomposition(Degenerate e-values)

Eigensolutions with degenerate eigenvalues (Possible?... or not?) Secular  $\rightarrow$  Hamilton-Cayley $\rightarrow$ Minimal equations Diagonalizability criterion

*Nilpotents and "Bad degeneracy" examples:*  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ *, and:*  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ *Applications of Nilpotent operators later on* 

*Idempotents and "Good degeneracy" example:*  $\mathbf{G} = \begin{pmatrix} \cdot & \cdot & 1 \\ \cdot & 1 & \cdot \\ \cdot & 1 & \cdot \\ 1 & \cdot & \cdot \end{pmatrix}$ *Example of minimal equation projection* 

Orthonormalization of degenerate eigensolutions Projection  $\mathbf{P}_{j}$ -matrix anatomy (Gramian matrices) Gram-Schmidt procedure

Orthonormalization of commuting eigensolutions. Examples:  $\mathbf{G} = \begin{bmatrix} \cdots & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$  and:  $\mathbf{H} =$ The old "1=1.1 trick"-Spectral decomposition by projector splitting Irreducible projectors and representations (Trace checks) Minimal equation for projector  $\mathbf{P} = \mathbf{P}^2$ 

The **G** example is unusually convenient since components  $(\mathbf{P}_j)_{12}$  of projectors  $\mathbf{P}_j$  happen to *be zero*, and this means row-1 vector  $(j_1|$  is *already orthogonal* to row-2 vector  $|j_2|$ :  $(j_1|j_2) = 0$ 

Bra-Ket repeats may need to be <u>made</u> orthogonal. Two methods shown next: **1:** Gram-Schmidt orthogonalization (harder) **2:** Commuting projectors (easier)

The **G** example is unusually convenient since components  $(\mathbf{P}_j)_{12}$  of projectors  $\mathbf{P}_j$  happen to be zero, and this means row-1 vector  $(j_1|$  is already orthogonal to row-2 vector  $|j_2\rangle$ :  $(j_1|j_2) = 0$ Projection  $\mathbf{P}_j$ -matrix anatomy (Gramian matrices) If projector  $\mathbf{P}_j$  is idempotent  $(\mathbf{P}_j \mathbf{P}_j = \mathbf{P}_j)$ , all matrix elements  $(\mathbf{P}_j)_{bk}$  are row<sub>b</sub>-column<sub>k</sub>-•-products  $(j_b|j_k)$ 

(Preparing for: Degenerate eigenvalues)

Review: matrix eigenstates ("ownstates) and Idempotent projectors (Degeneracy case) *Operator orthonormality, completeness, and spectral decomposition*(<u>Degenerate e-values</u>)

*Eigensolutions with degenerate eigenvalues (Possible?... or not?)* Secular → Hamilton-Cayley → Minimal equations Diagonalizability criterion

Nilpotents and "Bad degeneracy" examples:  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ , and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ Applications of Nilpotent operators later on

*Idempotents and "Good degeneracy" example:*  $\mathbf{G} = \begin{pmatrix} \cdot & \cdot & 1 \\ \cdot & 1 & \cdot \\ \cdot & 1 & \cdot \\ 1 & \cdot & \cdot \end{pmatrix}$ Example of minimal equation projection

Orthonormalization of degenerate eigensolutions *Projection*  $\mathbf{P}_{i}$ *-matrix anatomy (Gramian matrices) Gram-Schmidt* procedure

*Orthonormalization of commuting eigensolutions. Examples:*  $\mathbf{G} = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$  *and:*  $\mathbf{H} = \begin{bmatrix} 1 & 1 & 1 \\ 1 & 1 & 1 \end{bmatrix}$ The old "1=1.1 trick"-Spectral decomposition by projector splitting *Irreducible projectors and representations (Trace checks)* 

The **G** example is unusually convenient since components  $(\mathbf{P}_j)_{12}$  of projectors  $\mathbf{P}_j$  happen to *be zero*, and this means row-1 vector  $(j_1|$  is *already orthogonal* to row-2 vector  $|j_2|$ :  $(j_1|j_2) = 0$  *Gram-Schmidt procedure* 

Suppose a non-zero scalar product  $(j_1|j_2) \neq 0$ . Replace vector  $|j_2\rangle$  with a vector  $|j_2\rangle = |j_{\neg 1}\rangle$  normal to  $(j_1|?)$ 

The **G** example is unusually convenient since components  $(\mathbf{P}_j)_{12}$  of projectors  $\mathbf{P}_j$  happen to be zero, and this means row-1 vector  $(j_1|$  is already orthogonal to row-2 vector  $|j_2\rangle$ :  $(j_1|j_2) = 0$ *Gram-Schmidt procedure* 

Suppose a non-zero scalar product  $(j_1|j_2) \neq 0$ . Replace vector  $|j_2\rangle$  with a vector  $|j_2\rangle = |j_{\neg 1}\rangle$  normal to  $(j_1|?)$ 

Define:  $|j_2\rangle = N_1|j_1\rangle + N_2|j_2\rangle$  such that:  $(j_1|j_2\rangle = 0 = N_1(j_1|j_1) + N_2(j_1|j_2)$ ...and normalized so that:  $\langle j_2|j_2\rangle = 1 = N_1^2(j_1|j_1) + N_1N_2[(j_1|j_2) + (j_2|j_1)] + N_2^2(j_2|j_2)$ 

The **G** example is unusually convenient since components  $(\mathbf{P}_j)_{12}$  of projectors  $\mathbf{P}_j$  happen to be zero, and this means row-1 vector  $(j_1|$  is already orthogonal to row-2 vector  $|j_2\rangle$ :  $(j_1|j_2) = 0$ *Gram-Schmidt procedure* 

Suppose a non-zero scalar product  $(j_1|j_2) \neq 0$ . Replace vector  $|j_2\rangle$  with a vector  $|j_2\rangle = |j_{\neg 1}\rangle$  normal to  $(j_1|?)$ 

Define:  $|j_2\rangle = N_1|j_1\rangle + N_2|j_2\rangle$  such that:  $(j_1|j_2\rangle = 0 = N_1(j_1|j_1) + N_2(j_1|j_2)$ ...and normalized so that:  $\langle j_2|j_2\rangle = 1 = N_1^2(j_1|j_1) + N_1N_2[(j_1|j_2) + (j_2|j_1)] + N_2^2(j_2|j_2)$ 

Solve these by substituting:  $N_1 = -N_2 (j_1|j_2)/(j_1|j_1)$ to give:  $1 = N_2^2 (j_1|j_2)^2/(j_1|j_1) - N_2^2[(j_1|j_2) + (j_2|j_1)](j_1|j_2)/(j_1|j_1) + N_2^2(j_2|j_2)$  $1/N_2^2 = (j_2|j_2) + (j_1|j_2)^2/(j_1|j_1) - (j_1|j_2)^2/(j_1|j_1) - (j_2|j_1)(j_1|j_2)/(j_1|j_1)$  $1/N_2^2 = (j_2|j_2) - (j_2|j_1)(j_1|j_2)/(j_1|j_1)$ 

The **G** example is unusually convenient since components  $(\mathbf{P}_j)_{12}$  of projectors  $\mathbf{P}_j$  happen to be zero, and this means row-1 vector  $(j_1|$  is already orthogonal to row-2 vector  $|j_2\rangle$ :  $(j_1|j_2) = 0$ *Gram-Schmidt procedure* 

Suppose a non-zero scalar product  $(j_1|j_2) \neq 0$ . Replace vector  $|j_2\rangle$  with a vector  $|j_2\rangle = |j_{\neg 1}\rangle$  normal to  $(j_1|?)$ 

Define:  $|j_2\rangle = N_1|j_1\rangle + N_2|j_2\rangle$  such that:  $(j_1|j_2\rangle = 0 = N_1(j_1|j_1) + N_2(j_1|j_2)$ ...and normalized so that:  $\langle j_2|j_2\rangle = 1 = N_1^2(j_1|j_1) + N_1N_2[(j_1|j_2) + (j_2|j_1)] + N_2^2(j_2|j_2)$ 

Solve these by substituting: 
$$N_1 = -N_2 (j_1|j_2)/(j_1|j_1)$$
  
to give:  $1 = N_2^2 (j_1|j_2)^2/(j_1|j_1) - N_2^2[(j_1|j_2) + (j_2|j_1)](j_1|j_2)/(j_1|j_1) + N_2^2(j_2|j_2)$   
 $1/N_2^2 = (j_2|j_2) + (j_1|j_2)^2/(j_1|j_1) - (j_1|j_2)^2/(j_1|j_1) - (j_2|j_1)(j_1|j_2)/(j_1|j_1)$   
 $1/N_2^2 = (j_2|j_2) - (j_2|j_1)(j_1|j_2)/(j_1|j_1)$ 

So the new orthonormal pair is:

$$\begin{aligned} |j_1\rangle &= \frac{|j_1\rangle}{\sqrt{(j_1|j_1)}} \\ |j_2\rangle &= N_1|j_1\rangle + N_2|j_2\rangle = -\frac{N_2(j_1|j_2)}{(j_1|j_1)}|j_1\rangle + N_2|j_2\rangle \\ &= N_2 \bigg( |j_2\rangle - \frac{(j_1|j_2)}{(j_1|j_1)}|j_1\rangle \bigg) = \sqrt{\frac{1}{(j_2|j_2) - \frac{(j_2|j_1)(j_1|j_2)}{(j_1|j_1)}}} \bigg( |j_2\rangle - \frac{(j_1|j_2)}{(j_1|j_1)}|j_1\rangle \bigg) \end{aligned}$$

The **G** example is unusually convenient since components  $(\mathbf{P}_j)_{12}$  of projectors  $\mathbf{P}_j$  happen to be zero, and this means row-1 vector  $(j_1|$  is already orthogonal to row-2 vector  $|j_2\rangle$ :  $(j_1|j_2) = 0$ *Gram-Schmidt procedure* 

Suppose a non-zero scalar product  $(j_1|j_2) \neq 0$ . Replace vector  $|j_2\rangle$  with a vector  $|j_2\rangle = |j_{\neg 1}\rangle$  normal to  $(j_1|?)$ 

Define:  $|j_2\rangle = N_1|j_1\rangle + N_2|j_2\rangle$  such that:  $(j_1|j_2\rangle = 0 = N_1(j_1|j_1) + N_2(j_1|j_2)$ ...and normalized so that:  $\langle j_2|j_2\rangle = 1 = N_1^2(j_1|j_1) + N_1N_2[(j_1|j_2) + (j_2|j_1)] + N_2^2(j_2|j_2)$ 

Solve these by substituting: 
$$N_1 = -N_2 (j_1|j_2)/(j_1|j_1)$$
  
to give:  $1 = N_2^2 (j_1|j_2)^2/(j_1|j_1) - N_2^2[(j_1|j_2) + (j_2|j_1)](j_1|j_2)/(j_1|j_1) + N_2^2(j_2|j_2)$   
 $1/N_2^2 = (j_2|j_2) + (j_1|j_2)^2/(j_1|j_1) - (j_1|j_2)^2/(j_1|j_1) - (j_2|j_1)(j_1|j_2)/(j_1|j_1)$   
 $1/N_2^2 = (j_2|j_2) - (j_2|j_1)(j_1|j_2)/(j_1|j_1)$ 

So the new orthonormal pair is:

$$|j_1\rangle = \frac{|j_1|}{\sqrt{(j_1|j_1)}} |j_2\rangle = N_1|j_1\rangle + N_2|j_2\rangle = -\frac{N_2(j_1|j_2)}{(j_1|j_1)}|j_1\rangle + N_2|j_2\rangle = N_2 \left(|j_2\rangle - \frac{(j_1|j_2)}{(j_1|j_1)}|j_1\rangle\right) = \sqrt{\frac{1}{(j_2|j_2) - \frac{(j_2|j_1)(j_1|j_2)}{(j_1|j_1)}}} \left(|j_2\rangle - \frac{(j_1|j_2)}{(j_1|j_1)}|j_1\rangle\right)$$

OK. That's for 2 vectors. Like to try for 3?

The **G** example is unusually convenient since components  $(\mathbf{P}_j)_{12}$  of projectors  $\mathbf{P}_j$  happen to be zero, and this means row-1 vector  $(j_1|$  is already orthogonal to row-2 vector  $|j_2\rangle$ :  $(j_1|j_2) = 0$ *Gram-Schmidt procedure* 

Suppose a non-zero scalar product  $(j_1|j_2) \neq 0$ . Replace vector  $|j_2\rangle$  with a vector  $|j_2\rangle = |j_{\neg 1}\rangle$  normal to  $(j_1|?)$ 

Define:  $|j_2\rangle = N_1|j_1\rangle + N_2|j_2\rangle$  such that:  $(j_1|j_2\rangle = 0 = N_1(j_1|j_1) + N_2(j_1|j_2)$ ...and normalized so that:  $\langle j_2|j_2\rangle = 1 = N_1^2(j_1|j_1) + N_1N_2[(j_1|j_2) + (j_2|j_1)] + N_2^2(j_2|j_2)$ 

Solve these by substituting: 
$$N_1 = -N_2 (j_1|j_2)/(j_1|j_1)$$
  
to give:  $1 = N_2^2 (j_1|j_2)^2/(j_1|j_1) - N_2^2[(j_1|j_2) + (j_2|j_1)](j_1|j_2)/(j_1|j_1) + N_2^2(j_2|j_2)$   
 $1/N_2^2 = (j_2|j_2) + (j_1|j_2)^2/(j_1|j_1) - (j_1|j_2)^2/(j_1|j_1) - (j_2|j_1)(j_1|j_2)/(j_1|j_1)$   
 $1/N_2^2 = (j_2|j_2) - (j_2|j_1)(j_1|j_2)/(j_1|j_1)$ 

| ; \

So the new orthonormal pair is:

$$|j_1\rangle = \frac{|j_1\rangle}{\sqrt{(j_1|j_1)}} |j_2\rangle = N_1|j_1\rangle + N_2|j_2\rangle = -\frac{N_2(j_1|j_2)}{(j_1|j_1)}|j_1\rangle + N_2|j_2\rangle = N_2 \left(|j_2\rangle - \frac{(j_1|j_2)}{(j_1|j_1)}|j_1\rangle\right) = \sqrt{\frac{1}{(j_2|j_2\rangle - \frac{(j_2|j_1)(j_1|j_2)}{(j_1|j_1)}}} \left(|j_2\rangle - \frac{(j_1|j_2)}{(j_1|j_1)}|j_1\rangle\right)$$

OK. That's for 2 vectors. Like to try for 3?

Instead, let' try another way to "orthogonalize" that might be more *elegante*.

(Preparing for: Degenerate eigenvalues)

Review: matrix eigenstates ("ownstates) and Idempotent projectors (Degeneracy case) Operator orthonormality, completeness, and spectral decomposition (Degenerate e-values)

(Preparing for: Degenerate eigenvalues)

Review: matrix eigenstates ("ownstates) and Idempotent projectors (Degeneracy case) Operator orthonormality, completeness, and spectral decomposition(Degenerate e-values)

Eigensolutions with degenerate eigenvalues (Possible?... or not?) Secular  $\rightarrow$  Hamilton-Cayley $\rightarrow$ Minimal equations Diagonalizability criterion

*Nilpotents and "Bad degeneracy" examples:*  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ *, and:*  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ *Applications of Nilpotent operators later on* 

Idempotents and "Good degeneracy" example:  $\mathbf{G} = \begin{pmatrix} \cdot & \cdot & 1 \\ \cdot & 1 & \cdot \\ 1 & \cdot & 1 \end{pmatrix}$ Secular equation by minor expansion Example of minimal equation projection Orthonormalization of degenerate eigensolutions Projection  $\mathbf{P}_{i}$ -matrix anatomy (Gramian matrices)

Gram-Schmidt procedure

Another Problem: How do you tell when a Projector  $P_g^G$  or  $P_{g,h}^{GH}$  is 'splittable' (Correct term is *reducible*.) Solution: It's all in the matrix Trace:

Trace ( $\mathbf{P}_{+1}^{\mathbf{G}}$ )=2 so that projector is *reducible* to 2 irreducible projectors. (In this case:  $\mathbf{P}_{+1}^{\mathbf{G}} = \mathbf{P}_{+1+2}^{\mathbf{G}H} + \mathbf{P}_{+1-2}^{\mathbf{G}H}$ ) Trace  $(\mathbf{P}_{+1,+2}^{\mathbf{GH}}) = 1$  so that projector is *irreducible*.

Trace (1)=4 so that is *reducible* to 4 irreducible projectors.

Minimal equation for an idempotent projector is:  $P^2 = P$  or:  $P^2 - P = (P - \partial \cdot 1)(P - 1 \cdot 1) = 0$ So projector eigenvalues are limited to repeated 0's and 1's. Trace counts the latter.

#### *The old* "**1=1**.1 *trick*"

Multiplying G and H completeness relations gives a set of projectors and eigen-relations for both:  $1 = 1 \cdot 1 = \left(P_{+1}^{G} + P_{-1}^{G}\right) \left(P_{+2}^{H} + P_{-2}^{H}\right) = 1 = \left(P_{+1}^{G} P_{+2}^{H} + P_{-1}^{G} P_{+2}^{H} + P_{-1}^{G} P_{+2}^{H} + P_{-1}^{G} P_{-2}^{H}\right)$   $GP^{GH} = GP^{G}P^{H} = c^{G}P^{G}P^{H}$ 

$$\mathbf{P}_{+1,+2}^{\mathbf{GH}} \equiv \mathbf{P}_{+1}^{\mathbf{G}} \mathbf{P}_{+2}^{\mathbf{H}} = \mathbf{P}_{+1}^{\mathbf{G}} \mathbf{P}_{+2}^{\mathbf{H}} = \mathbf{P}_{+1}^{\mathbf{G}} \mathbf{P}_{-2}^{\mathbf{H}} = \mathbf{P}_{-1,+2}^{\mathbf{G}} \equiv \mathbf{P}_{-1}^{\mathbf{G}} \mathbf{P}_{+2}^{\mathbf{H}} = \mathbf{P}_{-1,+2}^{\mathbf{G}} \equiv \mathbf{P}_{-1}^{\mathbf{G}} \mathbf{P}_{-2}^{\mathbf{H}} = \mathbf{P}_{-1,+2}^{\mathbf{G}} \equiv \mathbf{P}_{-1,+2}^{\mathbf$$

...and a the same  $P_{g,h}^{GH}$  projectors spectrally resolve both G and H.

 $\mathbf{P}_{+1,+2}^{\mathbf{GH}} \equiv \mathbf{P}_{+1}^{\mathbf{G}} \mathbf{P}_{+2}^{\mathbf{H}} = \mathbf{P}_{+1,-2}^{\mathbf{GH}} \equiv \mathbf{P}_{+1}^{\mathbf{G}} \mathbf{P}_{-2}^{\mathbf{H}} = \mathbf{P}_{-1,+2}^{\mathbf{GH}} \equiv \mathbf{P}_{-1}^{\mathbf{G}} \mathbf{P}_{+2}^{\mathbf{H}} = \mathbf{P}_{-1,-2}^{\mathbf{GH}} \equiv \mathbf{P}_{-1,-2}^{\mathbf{GH}} \equiv \mathbf{P}_{-1,-2}^{\mathbf{GH}} \equiv \mathbf{P}_{-1,-2}^{\mathbf{GH}} \equiv \mathbf{P}_{-1,-2}^{\mathbf{GH}} = \mathbf{P}$ 

 $\mathbf{G} = (+1)\mathbf{P}_{+1,+2}^{\mathbf{GH}} + (+1)\mathbf{P}_{+1,-2}^{\mathbf{GH}} + (-1)\mathbf{P}_{-1,+2}^{\mathbf{GH}} + (-1)\mathbf{P}_{-1,-2}^{\mathbf{GH}}$  $\mathbf{H} = (+2)\mathbf{P}_{+1,+2}^{\mathbf{GH}} + (-2)\mathbf{P}_{+1,-2}^{\mathbf{GH}} + (+2)\mathbf{P}_{-1,+2}^{\mathbf{GH}} + (-2)\mathbf{P}_{-1,+2}^{\mathbf{GH}} + (-2)\mathbf$ 

(Preparing for: Degenerate eigenvalues)

Review: matrix eigenstates ("ownstates) and Idempotent projectors (Degeneracy case) Operator orthonormality, completeness, and spectral decomposition (Degenerate e-values)

*Eigensolutions with degenerate eigenvalues (Possible?... or not?) Secular* → *Hamilton-Cayley* → *Minimal equations* Diagonalizability criterion

*Nilpotents and "Bad degeneracy" examples:*  $\mathbf{B} = \begin{pmatrix} b & 1 \\ 0 & b \end{pmatrix}$ , and:  $\mathbf{N} = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix}$ Applications of Nilpotent operators later on

*Idempotents and "Good degeneracy" example:*  $\mathbf{G} = \begin{pmatrix} \cdot & \cdot & 1 \\ \cdot & 1 & \cdot \\ \cdot & 1 & \cdot \\ 1 & \cdot & \cdot \end{pmatrix}$ Example of minimal equation projection Orthonormalization of degenerate eigensolutions *Projection* **P**<sub>*i*</sub>*-matrix anatomy (Gramian matrices)* 

Gram-Schmidt procedure

Orthonormalization of commuting eigensolutions. Examples:  $\mathbf{G} = \begin{pmatrix} \cdot & \cdot & \cdot & 1 \\ \cdot & \cdot & 1 & \cdot \\ 1 & \cdot & \cdot & \cdot \end{pmatrix}$  and:  $\mathbf{H} = \begin{pmatrix} \cdot & \cdot & 2 & \cdot \\ \cdot & \cdot & \cdot & 2 \\ 2 & \cdot & \cdot & \cdot \\ \cdot & 2 & \cdot & \cdot \end{pmatrix}$ The old "1=1.1 trick"-Spectral decomposition by projector split *Irreducible projectors and representations (Trace checks) Minimal equation for projector* **P**=**P**<sup>2</sup> How symmetry groups become eigen-solvers

Suppose you need to diagonalize a complicated operator  $\mathbf{K}$  and knew that  $\mathbf{K}$  commutes with some other operators  $\mathbf{G}$  and  $\mathbf{H}$  for which irreducible projectors are more easily found.

**KG = GK** or $G^{\dagger}KG = K$  or $GKG^{\dagger} = K$ (Here assuming unitary**KH = HK** or $H^{\dagger}KH = K$  or $HKH^{\dagger} = K$  $G^{\dagger} = G^{-1}$  and  $H^{\dagger} = H^{-1}$ .)

Suppose you need to diagonalize a complicated operator  $\mathbf{K}$  and knew that  $\mathbf{K}$  commutes with some other operators  $\mathbf{G}$  and  $\mathbf{H}$  for which irreducible projectors are more easily found.

**KG = GK** or $G^{\dagger}KG = K$  or $GKG^{\dagger} = K$ (Here assuming *unitary***KH = HK** or $H^{\dagger}KH = K$  or $HKH^{\dagger} = K$  $G^{\dagger} = G^{-1}$  and  $H^{\dagger} = H^{-1}$ .)

This means **K** is *invariant* to the transformation by **G** and **H** and all their products GH,  $GH^2$ ,  $G^2H$ ,... *etc*. and all their inverses  $G^{\dagger}$ ,  $H^{\dagger}$ ,... etc.

Suppose you need to diagonalize a complicated operator  $\mathbf{K}$  and knew that  $\mathbf{K}$  commutes with some other operators  $\mathbf{G}$  and  $\mathbf{H}$  for which irreducible projectors are more easily found.

**KG = GK** or $G^{\dagger}KG = K$  or $GKG^{\dagger} = K$ (Here assuming *unitary***KH = HK** or $H^{\dagger}KH = K$  or $HKH^{\dagger} = K$  $G^{\dagger} = G^{-1}$  and  $H^{\dagger} = H^{-1}$ .)

This means **K** is *invariant* to the transformation by **G** and **H** and all their products **GH**, **GH**<sup>2</sup>, **G**<sup>2</sup>**H**,... *etc*. and all their inverses **G**<sup>†</sup>, **H**<sup>†</sup>,.. etc.

The group  $\mathscr{G}_{\mathbf{K}} = \{\mathbf{1}, \mathbf{G}, \mathbf{H}, ...\}$  so formed by such operators is called a *symmetry group* for **K**.

Suppose you need to diagonalize a complicated operator  $\mathbf{K}$  and knew that  $\mathbf{K}$  commutes with some other operators  $\mathbf{G}$  and  $\mathbf{H}$  for which irreducible projectors are more easily found.

KG = GK orG<sup>†</sup>KG = KorGKG<sup>†</sup> = K(Here assuming unitaryKH = HK orH<sup>†</sup>KH = KorHKH<sup>†</sup> = KG<sup>†</sup>=G<sup>-1</sup> and H<sup>†</sup>=H<sup>-1</sup>.)

This means **K** is *invariant* to the transformation by **G** and **H** and all their products **GH**, **GH**<sup>2</sup>, **G**<sup>2</sup>**H**,... *etc*. and all their inverses **G**<sup>†</sup>, **H**<sup>†</sup>,.. etc.

The group  $\mathscr{G}_{\mathbf{K}} = \{1, \mathbf{G}, \mathbf{H}, ...\}$  so formed by such operators is called a *symmetry group* for **K**.

In certain ideal cases a **K**-matrix  $\langle \mathbf{K} \rangle$  is a linear combination of matrices  $\langle \mathbf{1} \rangle, \langle \mathbf{G} \rangle, \langle \mathbf{H} \rangle, \dots$  from  $\mathscr{G}_{\mathbf{K}}$ . Then spectral resolution of  $\{\langle \mathbf{1} \rangle, \langle \mathbf{G} \rangle, \langle \mathbf{H} \rangle, \dots \}$  also resolves  $\langle \mathbf{K} \rangle$ .

Then spectral resolution of  $\{\langle \mathbf{1} \rangle, \langle \mathbf{G} \rangle, \langle \mathbf{H} \rangle, \dots \}$  also resolves  $\langle \mathbf{K} \rangle$ .

We will study ideal cases first. More general cases are built from these.

#### Matrix products and eigensolutions for active analyzers

Consider a 45° tilted ( $\theta_1 = \beta_1/2 = \pi/4$  or  $\beta_1 = 90^\circ$ ) analyzer followed by a untilted ( $\beta_2 = 0$ ) analyzer. Active analyzers have both paths open and a phase shift  $e^{-i\Omega}$  between each path. Here the first analyzer has  $\Omega_1 = 90^\circ$ . The second has  $\Omega_2 = 180^\circ$ .

The transfer matrix for each analyzer is a sum of projection operators for each open path multiplied by the phase factor that is active at that path. Apply phase factor  $e^{-i\Omega 1} = e^{-i\pi/2}$  to top path in the first analyzer and the factor  $e^{-i\Omega 2} = e^{-i\pi}$  to the top path in the second analyzer.

$$T(2) = e^{-i\pi} |x\rangle\langle x| + |y\rangle\langle y| = \begin{pmatrix} e^{-i\pi} & 0\\ 0 & 1 \end{pmatrix} \qquad T(1) = e^{-i\pi/2} |x'\rangle\langle x'| + |y'\rangle\langle y'| = e^{-i\pi/2} \begin{pmatrix} \frac{1}{2} & \frac{1}{2}\\ \frac{1}{2} & \frac{1}{2} \end{pmatrix} + \begin{pmatrix} \frac{1}{2} & \frac{-1}{2}\\ \frac{-1}{2} & \frac{1}{2} \end{pmatrix} = \begin{pmatrix} \frac{1-i}{2} & \frac{-1-i}{2}\\ \frac{-1-i}{2} & \frac{1-i}{2} \end{pmatrix}$$

The matrix product T(total) = T(2)T(1) relates input states  $|\Psi_{IN}\rangle$  to output states:  $|\Psi_{OUT}\rangle = T(total)|\Psi_{IN}\rangle$ 

$$T(total) = T(2)T(1) = \begin{pmatrix} -1 & 0 \\ 0 & 1 \end{pmatrix} \begin{pmatrix} \frac{1-i}{2} & \frac{-1-i}{2} \\ \frac{-1-i}{2} & \frac{1-i}{2} \end{pmatrix} = \begin{pmatrix} \frac{-1+i}{2} & \frac{1+i}{2} \\ \frac{-1-i}{2} & \frac{1-i}{2} \end{pmatrix} = e^{-i\pi/4} \begin{pmatrix} \frac{-1}{\sqrt{2}} & \frac{i}{\sqrt{2}} \\ \frac{-i}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{-i}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{pmatrix} \sim \begin{pmatrix} \frac{-1}{\sqrt{2}} & \frac{i}{\sqrt{2}} \\ \frac{-i}{\sqrt{2}} & \frac{1}{\sqrt{2}} \\ \frac{-i}{\sqrt{2}} & \frac{1}{\sqrt{2}} \end{pmatrix}$$

We drop the overall phase  $e^{-i\pi/4}$  since it is unobservable. T(total) yields two eigenvalues and projectors.

$$\lambda^{2} - 0\lambda - 1 = 0, \text{ or: } \lambda = +1, -1$$
, gives projectors
$$P_{+1} = \underbrace{\begin{pmatrix} -i & i \\ \sqrt{2} & 1 \\ \sqrt{2} & \sqrt{2} \end{pmatrix}}_{1 - (-1)} = \underbrace{\begin{pmatrix} -1 + \sqrt{2} & i \\ -i & 1 + \sqrt{2} \end{pmatrix}}_{2\sqrt{2}}, P_{-1} = \underbrace{\begin{pmatrix} 1 + \sqrt{2} & -i \\ i & -1 + \sqrt{2} \end{pmatrix}}_{2\sqrt{2}}$$
