Introduction to Spinor-Vector resonance dynamics

(Ch. 2-4 of Unit 4 Ch. 6-7 of Unit 6)

Review: 2D harmonic oscillator equations with Lagrangian and matrix forms

ANALOGY: 2-State Schrodinger: $i\hbar\partial_t|\Psi(t)\rangle = \mathbf{H}|\Psi(t)\rangle$ versus Classical 2D-HO: $\partial_t^2\mathbf{x} = -\mathbf{K}\cdot\mathbf{x}$

Hamilton-Pauli spinor symmetry (σ -expansion in ABCD-Types) $\mathbf{H} = \omega_\mu \sigma_\mu$

Derive σ -exponential time evolution (or revolution) operator $\mathbf{U} = e^{-i\mathbf{H}t} = e^{-i\sigma_\mu \omega_\mu t}$

Spinor arithmetic like complex arithmetic

Spinor vector algebra like complex vector algebra

Spinor exponentials like complex exponentials (“Crazy-Thing”-Theorem)

Geometry of evolution (or revolution) operator $\mathbf{U} = e^{-i\mathbf{H}t} = e^{-i\sigma_\mu \omega_\mu t}$

The “mysterious” factors of 2 (or 1/2): 2D Spinor vs 3D Spin Vector space

2D Spinor vs 3D vector rotation

NMR Hamiltonian: 3D Spin Moment \mathbf{m} in \mathbf{B} field

Euler’s state definition using rotations $\mathbf{R}(\alpha, 0, 0)$, $\mathbf{R}(0, \beta, 0)$, and $\mathbf{R}(0, 0, \gamma)$

Spin-1 (3D-real vector) case

Spin-1/2 (2D-complex spinor) case

3D-real Stokes Vector defines 2D-HO polarization ellipses and spinor states

Asymmetry $S_A = S_Z$, Balance $S_B = S_X$, and Chirality $S_C = S_Y$

Polarization ellipse and spinor state dynamics

The “Great Spectral Avoided-Crossing” and A-to-B-to-A symmetry breaking

(Review of Lect. 21)

2D HO kinetic energy $T(v_1, v_2)$

$$T = \frac{1}{2} m_1 \dot{x}_1^2 + \frac{1}{2} m_2 \dot{x}_2^2$$

$$= \frac{1}{2} \langle \dot{\mathbf{x}} | \mathbf{M} | \dot{\mathbf{x}} \rangle$$

2D HO potential energy $V(x_1, x_2)$

$$V = \frac{1}{2} (k_1 + k_{12}) x_1^2 - k_{12} x_1 x_2 + \frac{1}{2} (k_2 + k_{12}) x_2^2$$

$$= \frac{1}{2} \langle \mathbf{x} | \mathbf{K} | \mathbf{x} \rangle$$

where: $\mathbf{K} = \begin{pmatrix} k_1 + k_{12} & -k_{12} \\ -k_{12} & k_2 + k_{12} \end{pmatrix}$

Lagrangian $L=T-V$

2D HO Lagrange equations

$$\frac{d}{dt} \left(\frac{\partial T}{\partial \dot{x}_1} \right) = m_1 \ddot{x}_1 = F_1 = -\frac{\partial V}{\partial x_1} = -(k_1 + k_{12}) x_1 + k_{12} x_2$$

$$\frac{d}{dt} \left(\frac{\partial T}{\partial \dot{x}_2} \right) = m_2 \ddot{x}_2 = F_2 = -\frac{\partial V}{\partial x_2} = k_{12} x_1 - (k_2 + k_{12}) x_2$$

2D HO Matrix operator equations

$$\begin{pmatrix} m_1 & 0 \\ 0 & m_2 \end{pmatrix} \begin{pmatrix} \ddot{x}_1 \\ \ddot{x}_2 \end{pmatrix} = - \begin{pmatrix} k_1 + k_{12} & -k_{12} \\ -k_{12} & k_2 + k_{12} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}$$

Matrix operator notation:

$$\mathbf{M} \cdot | \ddot{\mathbf{x}} \rangle = - \mathbf{K} \cdot | \mathbf{x} \rangle$$

2D harmonic oscillator equation solutions (Review of Lect. 21)

1. May rewrite equation $\mathbf{M} \cdot |\ddot{\mathbf{x}}\rangle = -\mathbf{K} \cdot |\mathbf{x}\rangle$ in acceleration matrix form: $|\ddot{\mathbf{x}}\rangle = -\mathbf{A}|\mathbf{x}\rangle$ where: $\mathbf{A} = \mathbf{M}^{-1} \cdot \mathbf{K}$

$$\begin{pmatrix} \ddot{x}_1 \\ \ddot{x}_2 \end{pmatrix} = - \begin{pmatrix} m_1 & 0 \\ 0 & m_2 \end{pmatrix}^{-1} \begin{pmatrix} k_1 + k_{12} & -k_{12} \\ -k_{12} & k_2 + k_{12} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix} = - \begin{pmatrix} \frac{k_1 + k_{12}}{m_1} & \frac{-k_{12}}{m_1} \\ \frac{-k_{12}}{m_2} & \frac{k_2 + k_{12}}{m_2} \end{pmatrix} \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}$$

2. Need to find *eigenvectors* $|\mathbf{e}_1\rangle, |\mathbf{e}_2\rangle, \dots$ of acceleration matrix such that: $\mathbf{A}|\mathbf{e}_n\rangle = \varepsilon_n|\mathbf{e}_n\rangle = \omega_n^2|\mathbf{e}_n\rangle$

Then equations decouple to: $|\ddot{\mathbf{e}}_n\rangle = -\mathbf{A}|\mathbf{e}_n\rangle = -\varepsilon_n|\mathbf{e}_n\rangle = -\omega_n^2|\mathbf{e}_n\rangle$ where ε_n is an *eigenvalue*
and ω_n is an *eigenfrequency*

Note eigenvalue is square of eigenfrequency

To introduce eigensolutions we take a simple case of unit masses ($m_1=1=m_2$)

So equation of motion is simply: $|\ddot{\mathbf{x}}\rangle = -\mathbf{K}|\mathbf{x}\rangle$

Eigenvectors $|\mathbf{x}\rangle = |\mathbf{e}_n\rangle$ are in special directions where $|\ddot{\mathbf{x}}\rangle = -\mathbf{K}|\mathbf{x}\rangle$ is in same direction as $|\mathbf{x}\rangle$

$$i\hbar|\dot{\Psi}(t)\rangle = \mathbf{H}|\Psi(t)\rangle$$

$$|\ddot{\mathbf{x}}\rangle = -\mathbf{K}\cdot|\mathbf{x}\rangle$$

First start with 2-by-2 Hermitian (self-conjugate) matrix

$$\mathbf{H} = \begin{pmatrix} A & B-iC \\ B+iC & D \end{pmatrix} = \mathbf{H}^\dagger$$

that operates on 2-D complex Dirac ket vector $|\Psi\rangle$.

Each Hamilton quaternion squares to *negative-1* ($\mathbf{i}^2 = \mathbf{j}^2 = \mathbf{k}^2 = -1$) like imaginary number $i^2 = -1$. (They make up the Quaternion group.)

Each Pauli $\boldsymbol{\sigma}_\mu$ squares to *positive-1* ($\boldsymbol{\sigma}_X^2 = \boldsymbol{\sigma}_Y^2 = \boldsymbol{\sigma}_Z^2 = +1$) (Each makes a cyclic C_2 group $C_2^A = \{\mathbf{1}, \boldsymbol{\sigma}_A\}$, $C_2^B = \{\mathbf{1}, \boldsymbol{\sigma}_B\}$, or $C_2^C = \{\mathbf{1}, \boldsymbol{\sigma}_C\}$.)

Note even powers of $(-i)$ are ± 1 and odd powers of $(-i)$ are $\pm i$: $(-i)^0 = +1$, $(-i)^1 = -i$, $(-i)^2 = -1$, $(-i)^3 = +i$, $(-i)^4 = +1$, $(-i)^5 = -i$, etc.

Hamilton replaces $(-i)$ with $-i\sigma_\varphi$ in the $e^{-i\varphi}$ power series above to get a sequence of terms just like it.

$$(-i\sigma_\varphi)^0 = +1, (-i\sigma_\varphi)^1 = -i\sigma_\varphi, (-i\sigma_\varphi)^2 = -1, (-i\sigma_\varphi)^3 = +i\sigma_\varphi, (-i\sigma_\varphi)^4 = +1, (-i\sigma_\varphi)^5 = -i\sigma_\varphi, \text{ etc.}$$

This allows Hamilton to generalize Euler's rotation $e^{-i\varphi}$ to $e^{-i\sigma_\varphi \varphi}$ for any $\sigma_\varphi \varphi = (\vec{\sigma} \cdot \vec{\varphi}) = \varphi_A \sigma_A + \varphi_B \sigma_B + \varphi_C \sigma_C = (\vec{\sigma} \cdot \hat{\varphi})\varphi$

$$e^{-i\varphi} = \mathbf{1} \cos \varphi - i \sin \varphi$$

generalizes to: $e^{-i\sigma_\varphi \varphi} = \mathbf{1} \cos \varphi - i \sigma_\varphi \sin \varphi$

Here:  = $-i$

Crazy thing is just $-\sqrt{-1}$

Here:  = $-i\sigma_\varphi = -i(\vec{\sigma} \cdot \hat{\varphi}) = -i \frac{(\vec{\sigma} \cdot \vec{\varphi})}{\varphi}$

The Great Spectral “Avoided-Crossing”

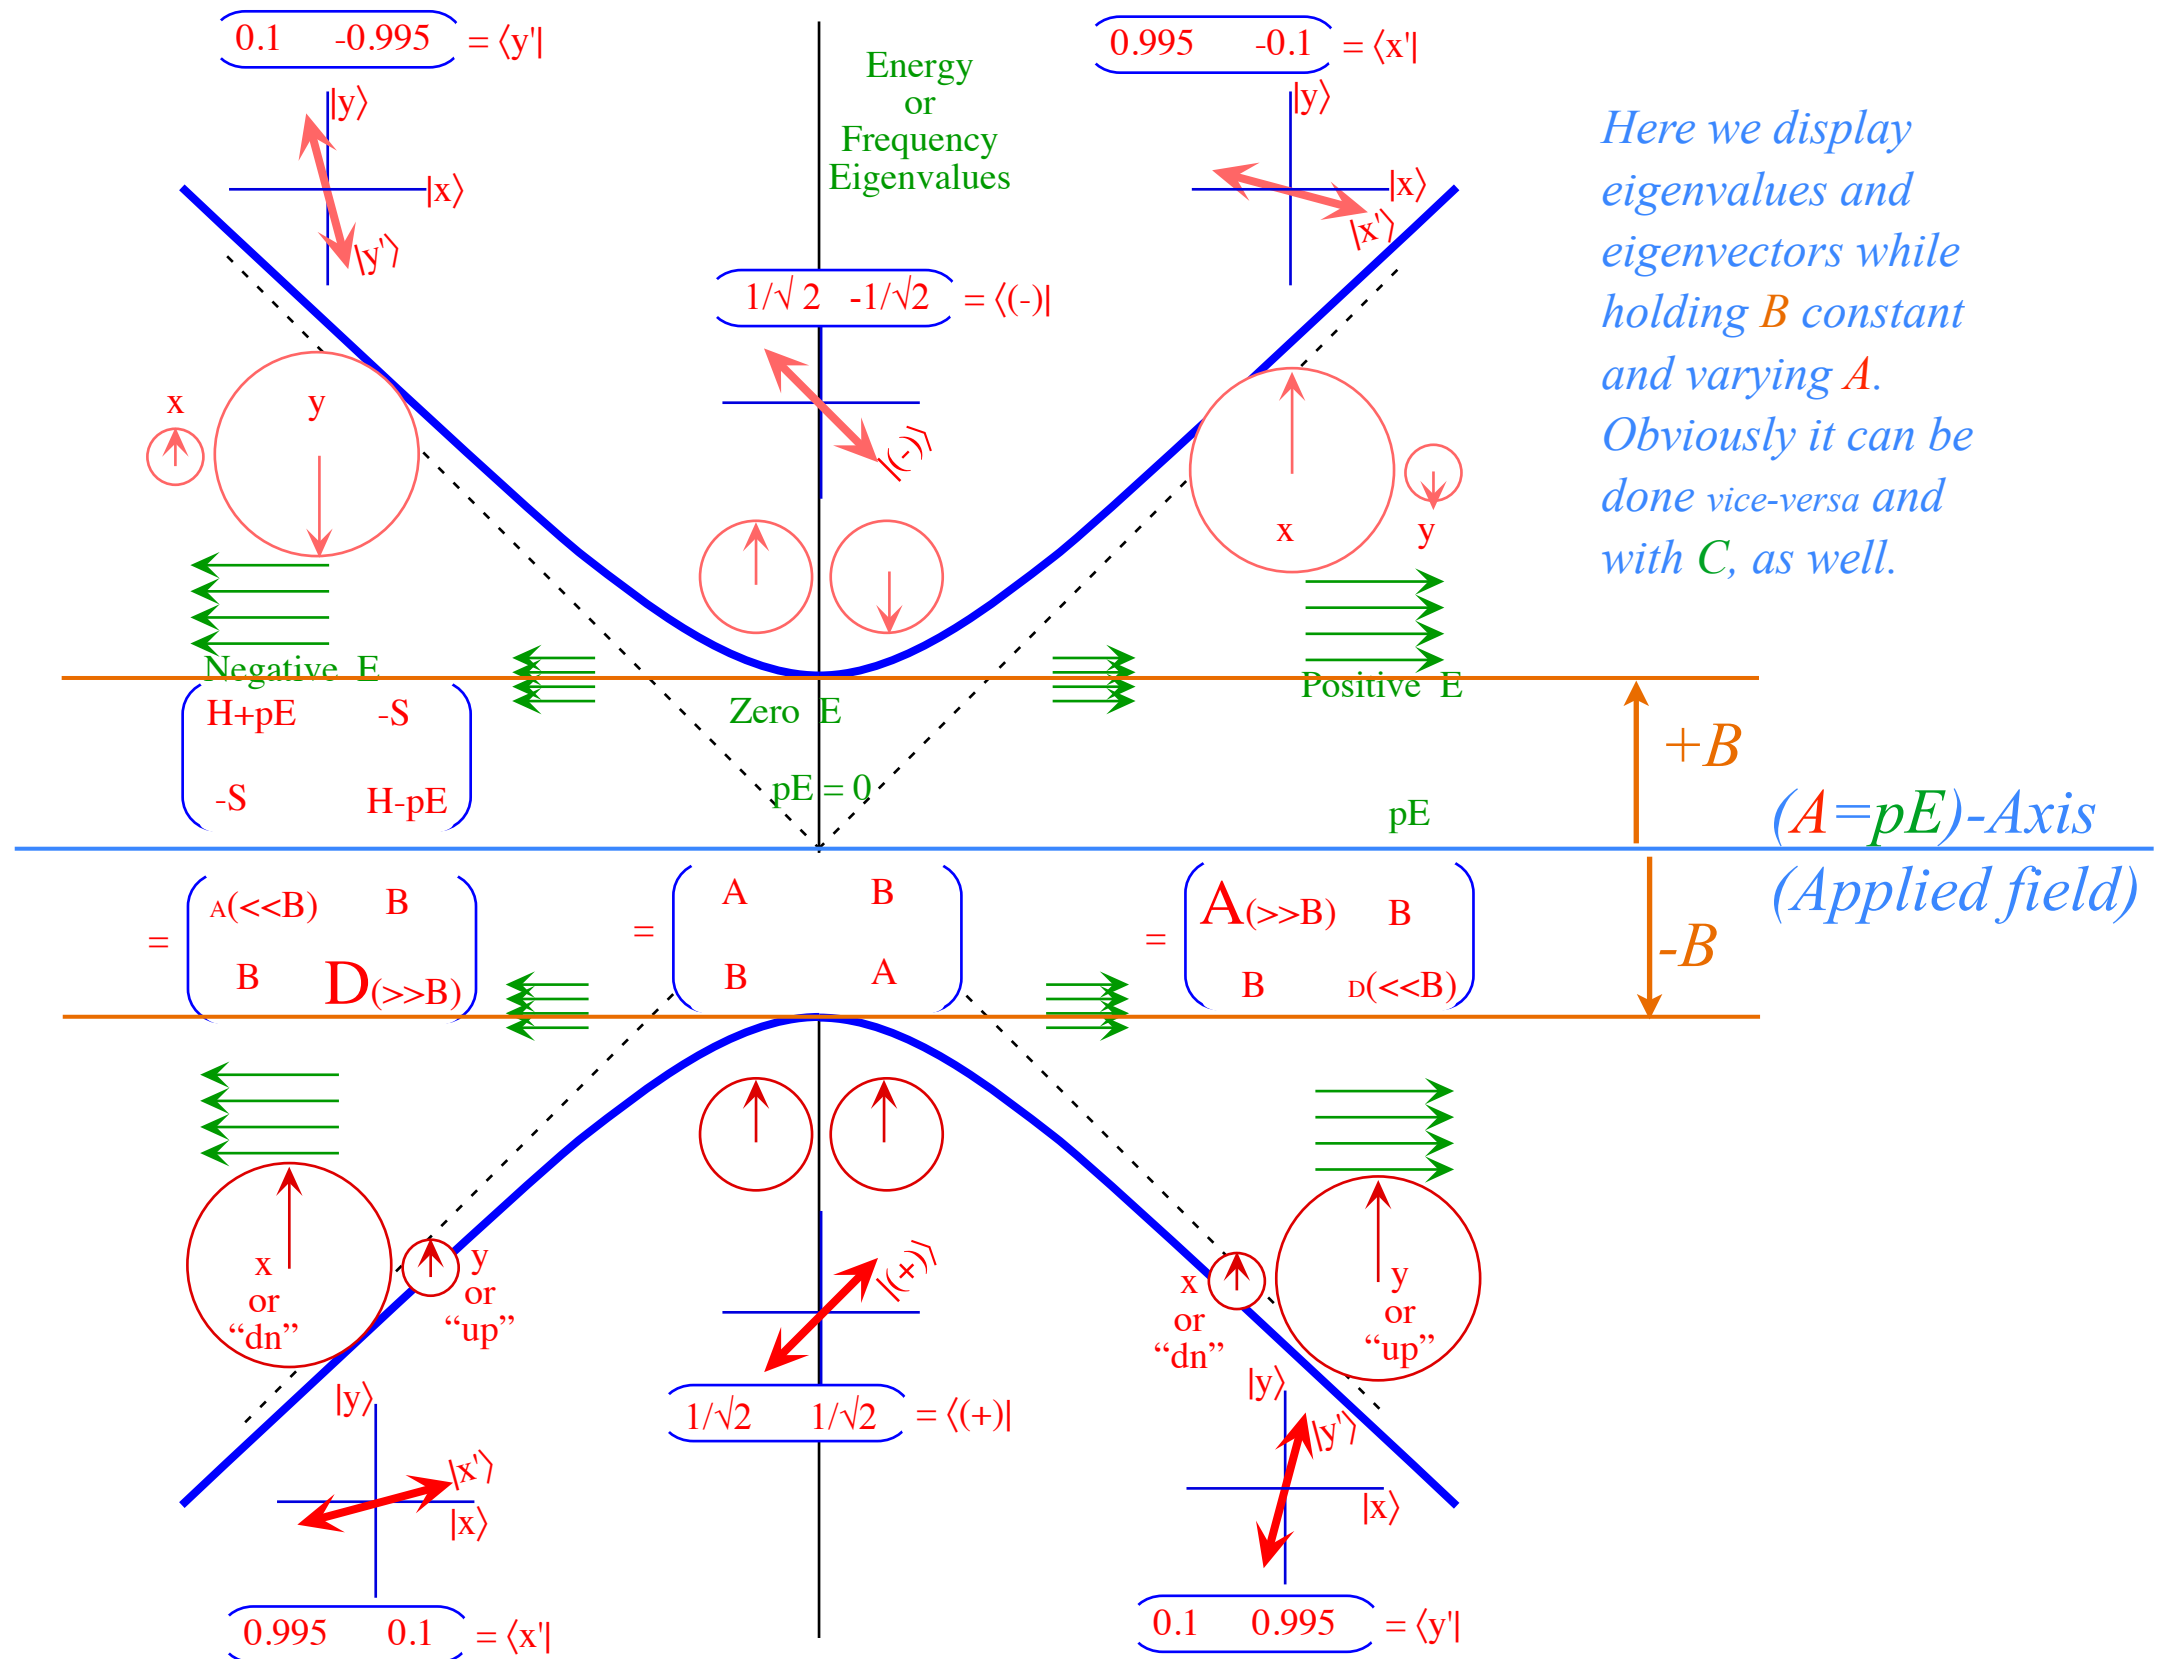

A to B to A Symmetry breaking described by hyperbolic eigenvalues of $A\sigma_A + B\sigma_B = \mathbf{H} = \begin{pmatrix} +A & B \\ B & -A \end{pmatrix}$

$\mathbf{H} = \begin{pmatrix} +A & B \\ B & -A \end{pmatrix}$ Secular equation: $\varepsilon^2 - 0 \cdot \varepsilon - (A^2 + B^2) = 0$ gives *hyperbolic* energy levels: $\varepsilon = \pm\sqrt{A^2 + B^2}$

Here we display eigenvalues and eigenvectors while holding B constant and varying A . Obviously it can be done vice-versa and with C , as well.

ABCD Time evolution operator

$$|\Psi(t)\rangle = e^{-i\mathbf{H}t}|\Psi(0)\rangle$$

Hamilton generalized Euler's expansion $e^{-i\Omega t} = \cos \Omega t - i \sin \Omega t$ so matrix exponential becomes powerful.

$$e^{-i\mathbf{H}t} = e^{-i \begin{pmatrix} A & B-iC \\ B+iC & D \end{pmatrix} t} = e^{-i \frac{A-D}{2} \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix} t - iB \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix} t - iC \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix} t - i \frac{A+D}{2} \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix} t} = e^{-i(\omega_0 \sigma_0 + \vec{\omega} \cdot \vec{\sigma})t} = e^{-i\omega_0 t} (\mathbf{1} \cos \omega t - i \sigma_{\omega} \sin \omega t)$$

$\sigma_A = \sigma_Z$ $\sigma_B = \sigma_X$ $\sigma_C = \sigma_Y$

where: $\vec{\varphi} = \vec{\omega} \cdot t = \begin{pmatrix} \omega_A \\ \omega_B \\ \omega_C \end{pmatrix} \cdot t = \begin{pmatrix} \frac{A-D}{2} \\ B \\ C \end{pmatrix} \cdot t$ and: $\omega_0 = \frac{A+D}{2}$ and: $\vec{\Theta} = \vec{\Omega} \cdot t = \begin{pmatrix} \Omega_A \\ \Omega_B \\ \Omega_C \end{pmatrix} \cdot t = \begin{pmatrix} A-D \\ 2B \\ 2C \end{pmatrix} \cdot t$ and: $\Omega_0 = \frac{A+D}{2}$

Symmetry relations make spinors σ_X , σ_Y , and σ_Z or quaternions $\mathbf{i} = -i\sigma_X$, $\mathbf{j} = -i\sigma_Y$, and $\mathbf{k} = -i\sigma_Z$ powerful.

3D *crank vector* $\vec{\Theta} = \vec{\Omega} \cdot t$ and *spin operator* \mathbf{S} defines 3D *ABC*-rotation with ratio $\frac{1}{2}$ or 2 between Θ_a and $\varphi_a = \frac{1}{2} \Theta_a$ or between \mathbf{S} and $\sigma = 2\mathbf{S}$.

$$e^{-i\sigma \cdot \vec{\varphi}} = e^{-i\sigma \cdot \vec{\Theta}/2} = e^{-i\mathbf{S} \cdot \vec{\Theta}} = \mathbf{1} \cos \frac{\Theta}{2} - i (\sigma \cdot \hat{\Theta}) \sin \frac{\Theta}{2} = \begin{pmatrix} \cos \frac{\Theta}{2} - i \hat{\Theta}_A \sin \frac{\Theta}{2} & (-i \hat{\Theta}_B - \hat{\Theta}_C) \sin \frac{\Theta}{2} \\ (-i \hat{\Theta}_B + \hat{\Theta}_C) \sin \frac{\Theta}{2} & \cos \frac{\Theta}{2} + i \hat{\Theta}_A \sin \frac{\Theta}{2} \end{pmatrix}$$

Example 3:
Any $\vec{\Theta} = \vec{\Omega}t$ -axial rotation

2D angle: $\varphi = \frac{1}{2} \Theta$

3D Crank vector: $\vec{\Theta} = \Theta \hat{\Theta} = 2\varphi_a \hat{a} = 2\vec{\varphi}$

2D spin matrix: $\mathbf{S} = \frac{1}{2} \sigma$

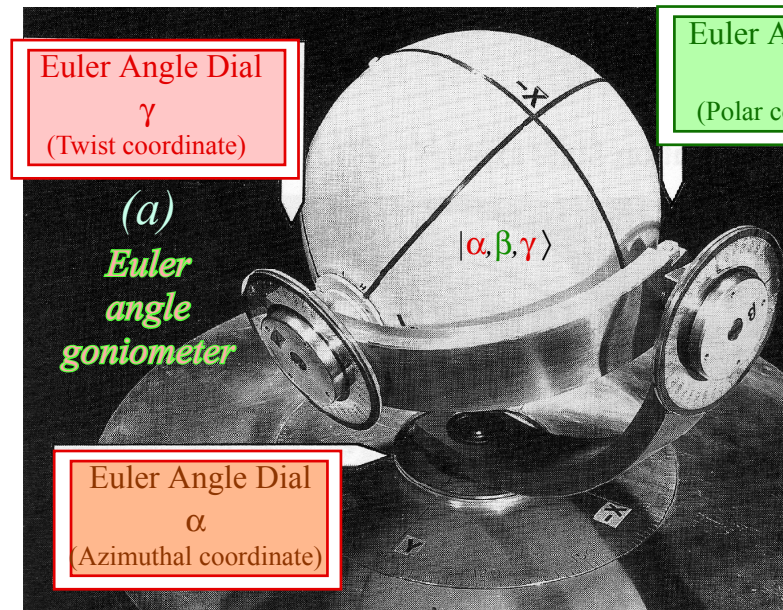

The driving $\vec{\Theta} = \vec{\Omega}t$ vector is defined by the *ABCD* of Hamiltonian \mathbf{H} .

The driven spin vector \mathbf{S} defines the state. But, how?

Let: $A_1 = A \cos \beta/2$
 $A_2 = A \sin \beta/2$ Let: $\omega t + \rho_1 = (\gamma + \alpha)/2$
 $\omega t - \rho_1 = (\gamma - \alpha)/2$

$$\tan \beta/2 = A_2/A_1 \quad A^2 = A_1^2 + A_2^2$$

$$\alpha = 2\rho_1 \quad \gamma = 2\omega t$$

Euler parameters $(\alpha, \beta, \gamma, A)$ in terms of amp-phase parameters $(A_1, A_2, \omega t, \rho_1)$
